

Simulated Effects of Changes to State and Federal Asset Eligibility Policies for the Food Stamp Program

Contractor and Cooperator Report No. 49
October 2008

By Karen Cunyningham and James Ohls, Mathematica Policy Research, Inc.

Abstract

This study uses a microsimulation model to assess the effect of changes to State-level Food Stamp Program (FSP) asset rules on household eligibility and on the benefits that eligible households would receive. The findings show that 7 percent of households eligible in 2006 were eligible only through expanded categorical eligibility rules that exempted the households from the standard Federal FSP asset rules and that 1 percent of eligible households were eligible because of State rules that counted fewer vehicle assets toward the asset limits. The number of eligible households would increase by about 3 percent if asset limits were raised by \$2,000, by 22 percent if the asset test were eliminated, by 2 percent if retirement accounts were excluded, and by less than half of 1 percent if all vehicles were excluded. Eligibility across States varied widely, with 32 percent of households eligible in at least one State but not eligible in all States. The Food Stamp Program was renamed to the Supplemental Nutrition Assistance Program (SNAP) in October 2008.

This study was conducted by Mathematica Policy Research, Inc., under a cooperative research contract with USDA's Economic Research Service (ERS) Food and Nutrition Assistance Research Program (FANRP): contract number 59-5000-6-0077 (ERS project representative: Kenneth Hanson). The views expressed are those of the authors and not necessarily those of ERS or USDA.

ACKNOWLEDGMENTS

This work was conducted through a cooperative agreement research grant from the Food Assistance and Nutrition Research Program at the U.S. Department of Agriculture, Economic Research (ERS). The authors would like to extend their gratitude to the many people who contributed to this research. In particular, we would like to thank Kenneth Hanson for his guidance and support throughout the project. We also received valuable input on methodology and presentation from additional staff at ERS, including David Smallwood, Margaret Andrews, Mark Prell, and John Kirlin, and from Jenny Genser and Kristen Hyatt from the U.S. Department of Agriculture, Food and Nutrition Service. Bruce Schechter from Mathematica Policy Research, Inc (MPR) was a major contributor to this research, providing the majority of computer programming support. Additional MPR staff also contributed in important ways. Joel Smith and Laura Castner provided microsimulation model development support, and Carole Trippe assisted with research on state asset rules and reviewed the report. Finally, Carol Soble edited the report, and Jackie McGee and Lisa Walls were responsible for the report production.

EXECUTIVE SUMMARY

The Food Stamp Program (FSP) has served as a national “safety net” for many years, providing uniform food assistance to U.S. households that meet certain income and asset eligibility criteria established by Congress.¹ Over the past several years, a series of policy changes to the program have afforded states increased flexibility to set rules determining asset eligibility. These policy changes have allowed states to adapt the FSP to local conditions and to integrate the FSP with state-run assistance programs. Additional changes to FSP asset eligibility rules are often considered when the program is reauthorized and as part of the president’s annual budget proposals.

Effects of policy changes on program eligibility levels are of direct interest to policymakers, as are the resulting changes to benefit costs. It is also important for policymakers to understand the implications for targeting benefits to certain groups, such as those most in need of food assistance, low-income households with earnings, or households with elderly members. In addition, though state flexibility regarding FSP eligibility serves useful purposes, it raises questions concerning the degree to which FSP eligibility varies at the state level with only limited federal coordination. More generally, the fact that most of the changes in asset rules have occurred piecemeal—instituted by different states and at different times—raises the issue of whether the FSP may no longer fully serve its intended purpose as a national safety net.

A. METHODOLOGY

This study uses detailed information about state asset rules, coupled with three household-level data sets, to assess both past and possible future changes in FSP asset rules. The analytic

¹ The Food Stamp Program (FSP) was renamed the Supplemental Nutrition Assistance Program effective October 2008. In this report we refer to the FSP, the program’s name while this study was conducted.

technique is microsimulation—the use of computer models to simulate the FSP. Computer models permit us to examine the effects of policy changes at the household level, with the results weighted to provide state and national estimates. To conduct the research presented here, we employed two microsimulation models. The primary model used in the study is the MATH[®] SIPP+ model, which draws on data from the Survey of Income and Program Participation (SIPP) and the Current Population Survey (CPS).² Using that model, we estimate the number and characteristics of eligible and participating households, along with the benefits for which they qualify, under various asset rules. Although the body of the text focuses primarily on changes to eligible households and the benefits for which they are eligible, tables in the *Technical Appendices* to the main report are more extensive. They present data on participating households, benefits for participating households, and eligible and participating individuals. The appendix tables also include additional details on eligible households and their benefits. Estimates of benefits for which eligible households qualify provide information on the *maximum* benefit cost or savings under various policy scenarios, and estimates of benefits for participating households provide information on the *likely* benefit cost or savings. The second model used in the study is the QC Minimodel; it draws on FSP administrative data, which include detailed information on households' income, expenses, demographic characteristics, and categorical eligibility status. We use the second model to estimate participation levels under two policy changes.

Given that both the MATH SIPP+ model and QC Minimodel are static models, they do not incorporate behavioral responses to changes in FSP policies. Stated another way, they do not simulate an increase or decrease in a household's vehicle or financial assets in response to

² MATH (Micro Analysis of Transfers to Households) is a registered trademark of Mathematica Policy Research, Inc.

expansions or restrictions in the FSP asset test. The addition of a behavioral response module to the MATH SIPP+ model was beyond the scope of this project.

We began the study by conducting baseline simulations to estimate (1) FSP eligibility and participation under 2006 rules in the MATH SIPP+ model and (2) FSP participation in FY 2006 in the QC Minimodel. We then simulated three sets of policy changes in the MATH SIPP+ model and one set in the QC Minimodel:

- Simulations to eliminate recent state expansions in asset and categorical eligibility
- Simulations to change FSP asset limits, including elimination of the asset test
- Simulations to change the treatment of selected assets such as retirement accounts and vehicle assets
- More detailed simulations to eliminate recent state expansions in categorical eligibility (using the QC Minimodel)

This study was conducted before passage of the Food, Conservation, and Energy Act of 2008, which made some changes to FSP asset eligibility rules effective fiscal year 2009 while reauthorizing the program. Several of the policy changes enacted are similar to changes simulated for this study. Specifically, we simulated the exclusion of retirement savings accounts from countable assets and increases to the FSP asset limits. The increases to the asset limits that we simulated are larger than those enacted, although they are comparable to increases initially passed by the Senate. Note that we simulated each policy change separately, rather than simultaneously simulating multiple policy changes.

B. MAJOR FINDINGS

Using the MATH SIPP+ model, we estimate that 20.5 million households were eligible for the FSP in an average month in 2006 and that 11.5 million of those households chose to participate in the FSP (Table ES.1). Eligible households qualified for over \$3 billion in FSP benefits in an average month (Table ES.2). Among eligible households, 68 percent were in

poverty, 40 percent had earned income, and 19 percent reported low or very low food security. Less than half of eligible households had any financial assets, less than half had any vehicle assets, and only a quarter owned a home. Twenty-nine percent of eligible households included elderly members and 41 percent included children. On average, eligible households that choose to participate tend to have lower incomes, are less likely to include elderly members, more likely to include children, and are more likely to be food-insecure than all eligible households. Among participating households, 84 percent were in poverty, 35 percent had earned income, and 21 percent reported low or very low food security. Eighteen percent of participating households included elderly members and 49 percent included children.

1. Effects of Changes in State Asset and Categorical Eligibility Policies

The first set of policy changes we simulated estimate the effects of expansions in state FSP asset and categorical eligibility rules that were implemented in 2000 and 2001. States now have two options for expanding eligibility.

- They may align FSP vehicle rules with less restrictive rules governing certain other assistance programs, thereby counting fewer, if any, of a household's vehicle assets when determining FSP eligibility.
- They may confer categorical eligibility on additional households receiving cash or non-cash benefits from certain other assistance programs. Such households consequently become exempt from the federal FSP income and asset tests.

Through various enactments of the two options, most states have effectively replaced the federally defined FSP asset test. To estimate the effects of these state changes, we “turned the clock back” by simulating a reversion to federal FSP asset rules. Given that the state changes to asset rules expanded eligibility, the simulations of the reversion reduced the number of households eligible for the FSP. The results of our simulations show that:

- A substantial change in eligibility resulted from expansions in categorical eligibility. We estimate that 7 percent of the households eligible in 2006 were eligible only through expanded categorical eligibility, holding 2006 vehicle rules constant.
- Households eligible only through expanded categorical eligibility were eligible for only 4 percent of the benefits for which all eligible households qualified. This is because households eligible only under expanded categorical eligibility rules tend to have higher income than households that pass the income and asset tests, and thus qualify for lower benefits.
- State changes in the treatment of vehicle assets also increased eligibility, but to a much lesser degree compared to changes in categorical eligibility. We estimate that 1 percent of the households eligible in 2006 were eligible because of state rules that counted fewer vehicle assets toward the asset limits, holding 2006 categorical eligibility rules constant. These households were eligible for 1 percent of the benefits for which all eligible households qualified.
- Households made eligible by the vehicle policy and categorical eligibility expansions were likely to have income between 131 and 200 percent of poverty—higher than FSP households eligible under federal FSP rules (Table ES.3). In addition, households with earners disproportionately benefited from both the categorical eligibility and vehicle policy changes. On the other hand, households with elderly members benefited more than the average household from the categorical eligibility expansions and less from the changes to vehicle policies, and households with children benefited more from the changes to vehicle policies and less from the categorical eligibility expansions.

2. Effects of Changes to Asset Limits

Current federal law specifies limits for countable assets: \$2,000 for most households and \$3,000 for households with elderly or disabled members. Although the limits will be indexed to inflation beginning in fiscal year 2009, they have remained unchanged for most households for over 20 years while prices have risen substantially. As a result, FSP asset levels are now more

restrictive than they were earlier in the program. Some policymakers are concerned that current asset limits make it difficult for members of FSP households to save for education or retirement or to own reliable vehicles, thus diminishing the FSP's role as a work-support program.

TABLE ES.3
CHARACTERISTICS OF HOUSEHOLDS ELIGIBLE IN 2006 AND UNDER SIMULATED POLICY CHANGES

	Number of Eligible Households in 2006 (000s)	Percent Change Under Simulated Policy Change					
		Revert to Federal Asset Rules	Eliminate Categorical Eligibility	Increase Asset Limits by \$2,000	Eliminate the Asset Test	Exclude Assets in Retirement Accounts	Exclude All Vehicles
Total Households	20,493	-0.6	-7.4	2.8	21.7	1.7	0.3

Source: 2006 Baseline of 2002 MATH SIPP+ model, September 2007 update

In light of these concerns, various increases to FSP asset limits were considered during the recent FSP reauthorization process. To estimate the effect of the proposed increases, we conducted a series of four simulations that raised the asset limits in \$1,000 increments and another that eliminated the asset test. Major results show that:

- Raising the asset limits by \$2,000 would increase the number of eligible households by about 3 percent. The effect of an incremental increase in asset limits appears to decrease as the asset limits increase.

- The amount of benefits for which eligible households would qualify under the reform to increase asset limits by \$2,000 would also increase by about 3 percent. Larger increases in the asset limits, however, result in proportionally smaller increases in benefits. Raising the asset limits by \$4,000, which would result in a 5 percent increase in the number of eligible households, would result in only a 4 percent increase in potential benefits.
- As with the expansions in categorical eligibility, households that would become eligible under higher asset limits are more likely to have income slightly above poverty and to include elderly members.
- Elimination of the asset test would result in a 22 percent increase in the number of households eligible for the FSP and a 20 percent increase in amount of benefits for which eligible households would qualify, the largest increases for any of the simulations we conducted for the study. This policy change would increase eligibility for households with a broad range of characteristics, but, once again, the increase would be particularly large among households with income between 131 and 200 percent of poverty and among households with an elderly member. Because these types of households tend to participate in the FSP at lower than average rates, the increases in the number of participating households and amount of benefits for participating households would be less (17 percent).
- A large majority of income-eligible households, those that either pass or are not subject to the income tests, have low levels of countable assets. However, over 5 percent have more than \$50,000 in countable assets. Among households that are income eligible for the FSP but have at least \$7,000 in countable assets and fail the asset test, 61 percent have an elderly member, less than half are in poverty, and 84 percent have investment income. Very few such households have countable vehicle assets, while virtually all have countable financial assets (see Appendix B.)

3. Effects of Changes to Countable Assets

Many discussions about the FSP asset test focus on whether specific types of assets should be counted against the asset limit. For instance, the advisability of counting retirement assets, intended to support people in their later years, was addressed during the 2008 FSP reauthorization process because it is in the public interest to encourage saving for retirement. Discussions of whether to include vehicles in countable assets have centered around many households' need for reliable cars to provide transportation to work, the grocery store, medical appointments, and other important activities.

We tested the effects of excluding from countable assets, first, retirement accounts and, then, vehicles. Major results show that:

- The exclusion of retirement accounts would lead to a 2 percent increase in the number of eligible households. The number of households with slightly higher income than the average eligible household and the number of households with an elderly member would both increase by 3 percent under this policy change, slightly more than the overall increase. On the other hand, the number of households with an earner would increase by 1 percent, which, while statistically significant, is slightly less than the overall increase.
- We observe smaller effects for excluding vehicles from countable assets. If all vehicles were excluded, the increase in the number of eligible households would be less than half of 1 percent. If only one vehicle per driver in a household were excluded, the increase would be even smaller. The small effect of excluding additional vehicles from countable assets reflects, in part, the fact that many states already exclude all or most vehicles.
- The increases in the amount of benefits for which eligible households would qualify under these policy changes are similar to the corresponding increases in the number of eligible households.

4. Eligibility Rates

As part of our analysis, we constructed eligibility rates, or the percentages of households with incomes under 200 percent of poverty that would be eligible for the FSP, under simulated policy changes (Table ES.4). To summarize our findings:

- The overall eligibility rate was 55 percent in 2006. Households in poverty had an eligibility rate of 86 percent as compared to 12 percent for households with income between 131 and 200 percent of poverty.
- The overall eligibility rate varied from 50 to 66 percent under the simulated policy options.
- Elimination of the recent state expansions in categorical eligibility would lower the eligibility rates of households at all income levels but would have a larger effect on higher-income households.
- Elimination of the asset test would raise the eligibility rate of households in poverty by 14 percentage points to 100 percent. The eligibility rate for households with income slightly above poverty would increase even more, by 19 percentage points to 91 percent.

- Exclusion of retirement assets from countable assets would slightly raise the eligibility rates of lower-income households but would have a negligible effect on households with income between 131 and 200 percent of poverty. Households in this latter group that could be affected by a change in countable assets are limited to those that contain elderly or disabled members and thus are not subject to the FSP gross income test.

TABLE ES.4

PERCENTAGE OF HOUSEHOLDS BELOW 200 PERCENT OF POVERTY ELIGIBLE IN 2006 AND UNDER SIMULATED POLICY CHANGES

5. Variations in Eligibility across States

The effective devolution to the states of significant authority to set FSP asset rules has created the possibility that households with similar demographic characteristics, income, and assets might be eligible for the FSP in some states but not in others. Our microsimulation model

provides a convenient framework within which to examine the size of any disparities created by variation in state asset rules.

We found wide variation in eligibility across states. Under the rules in place in 2006, 32 percent of households that would be eligible in at least one state would not be eligible in all states (Table ES.5). An example of a household that would fall into this group is one that has enough vehicle assets that it would fail the asset test in states that include vehicles in countable assets, but would pass the asset test in states that exclude vehicles from countable assets.

TABLE ES.5

HOUSEHOLDS ELIGIBLE IN 2006 AND UNDER A SIMULATION TO ELIMINATE SSI CASH-OUT IN CALIFORNIA BY NUMBER OF STATES IN WHICH HOUSEHOLD WAS ELIGIBLE

	2006 Baseline		Eliminate SSI Cash-out in CA	
	Number (000s)	Percent Eligible	Number (000s)	Percent Eligible
Eligible Households	20,493	100.0	20,869	100.0
Households Eligible in All States	13,873	67.7	17,804	85.3
Households Eligible in Some But Not All States	6,620	32.3	3,065	14.7
Eligible in 47 to 50 States	4,353	21.2	818	3.9
Eligible in 50 States	4,021	19.6	459	2.2
Eligible in 6 to 46 States	1,960	9.6	1,947	9.3
Eligible in 1 to 5 States	306	1.5	300	1.4

Source: 2006 Baseline of 2002 MATH SIPP+ model, September 2007 update

Two thirds of households that were eligible in some but not all states, or 21 percent of all eligible households, were eligible in most states (at least 47) but were not eligible in all states (including the District of Columbia.) The majority of these households were ineligible in only 1 state. Less than 2 percent of all eligible households were eligible in only a few states (no more than 5) and another 10 percent were eligible in 6 to 46 states.

The largest source of variation among states is California’s policy that “cashes out” FSP benefits for recipients of Supplemental Security Income (SSI), thus rendering them ineligible for

the FSP. As a result of this policy, some households, for instance, those that consist solely of one or two SSI recipients, are eligible for the FSP in all states except California. A simulation that eliminated the SSI cash-out policy in California showed a substantial reduction in, but nonetheless considerable remaining, disparities. Under the simulated change in the California policy, the percentage eligible in at least one but not all states fell from 32 to 15 percent. However, as expected, the percentage of households eligible in 6 to 46 states remained approximately the same—9 percent.

We examined the effect of the different policy changes on variations in eligibility across states and found that:

- All the policy change simulations increased the percentage of eligible households that were eligible in all states (Table ES.6). For example, excluding all vehicles from countable assets would increase by 2 percentage points the percentage of eligible households that were eligible in all states.
- Elimination of the asset test would raise the percentage of eligible households that were eligible in all states to 76 percent, the highest among the policy changes simulated. The second-highest percentage eligible in all states—74 percent—resulted from the simulation that eliminated the state expansions in asset and categorical eligibility.
- Exclusion of retirement accounts from countable assets would have the smallest effect, raising the percentage of eligible households that were eligible in all states by only half a percentage point.

6. Effects on Participation of Eliminating State Expansions in Categorical Eligibility

The policy changes discussed above were simulated in the MATH SIPP+ model. In addition, we used the QC Minimodel to estimate the number and characteristics of households participating in FY 2006 and to simulate the elimination of recent expansions to categorical eligibility. While we used the MATH SIPP+ model primarily to examine the effect of changes on FSP eligibility, the QC Minimodel is ideal for examining the effect of changes on FSP participation. Based on the QC Minimodel, we estimate that 11.3 million eligible households

participated in the FSP in FY 2006 (Table ES.7). Of the participating households, 87 percent were in poverty.

TABLE ES.6

HOUSEHOLDS ELIGIBLE UNDER SIMULATED CHANGES TO ASSET AND CATEGORICAL ELIGIBILITY RULES BY NUMBER OF STATES IN WHICH HOUSEHOLD WAS ELIGIBLE

	Number of Eligible Households (000s)	Percentage Eligible under All State Rules	Percentage Eligible under Some But Not All State Rules
Baselaw: 2006 Baseline	20,493	67.7	32.3
Simulations to Eliminate State Expansions in Asset and Categorical Eligibility			
Revert to Federal FSP Asset Rules	20,367	68.1	31.9
Eliminate Categorical Eligibility	18,978	73.0	27.0
Revert to Federal Asset Rules and Eliminate Categorical Eligibility	18,841	73.5	26.5
Simulations to Change Asset Limits			
Increase Asset Limits by \$1,000	20,843	68.5	31.5
Increase Asset Limits by \$2,000	21,068	69.1	30.9
Increase Asset Limits by \$3,000	21,319	69.8	30.2
Increase Asset Limits by \$4,000	21,459	70.2	29.8
Eliminate the Asset Test	24,941	76.1	23.9
Simulations to Change Countable Assets			
Exclude Assets in Retirement Accounts	20,847	68.2	31.8
Exclude All Vehicles	20,545	69.7	30.3
Exclude One Vehicle per Driver	20,520	69.4	30.6

Source: 2006 Baseline of 2002 MATH SIPP+ model, September 2007 update

Using the QC Minimodel, we simulated two changes to categorical eligibility, first simulating the elimination of expanded categorical eligibility for all households and then simulating the elimination of expanded categorical eligibility for only those households that were categorically eligible through the receipt of non-cash benefits. In both these simulations, we did not subject households losing categorical eligibility to the FSP asset test because of limited information in the administrative data on asset holdings for these households. As a result, the simulations underestimate the number of participating households affected by the policy change.

TABLE ES.7

HOUSEHOLDS PARTICIPATING IN THE FOOD STAMP PROGRAM IN 2006
AND UNDER SIMULATED POLICY CHANGES

	Households Participating in 2006		Households Under Simulated Elimination of Categorical Eligibility			
	Number (000s)	Percent of Total	for Non-Pure Public Assistance Households		for Non-Pure Public Assistance Households Receiving Only Non-cash Benefits	
			Number (000s)	Percent Change	Number (000s)	Percent Change
Total Participating Households	11,315	100.0	11,205	-1.0	11,213	-0.9
Benefits Received (\$)	2,358,293	NA	2,354,132	-0.2	2,354,244	-0.2
Gross Income as a Percentage of Poverty Level						
At or Below 100%	9,847	87.0	9,847	0.0	9,847	0.0
101-130%	1,232	10.9	1,224	-0.6	1,226	-0.5
131-200%	223	2.0	127	-42.8	133	-40.1
Greater than 200%	14	0.1	7	-50.1	7	-48.2

Source: FY 2006 QC Minimodel

We found that:

- Elimination of expanded categorical eligibility would cause 1 percent of *participating* FSP households to lose eligibility for the program (Table III.17).
- Partial elimination of categorical eligibility—that conferred through the receipt of non-cash benefits—would reduce *participation* by only slightly less.
- The households that would be affected by the simulated reductions in eligibility have higher income than *participating* households that would remain eligible (Table III.18). Thus, the percentage reductions in benefits received by *participating* households would be small (0.2 percent).

Note that these estimates differ from the ones presented in section B.1 for the three reasons mentioned above: 1) these estimates are of participating households rather than eligible households; 2) the simulations were conducted in the QC Minimodel rather than the MATH SIPP+ model; and 3) these simulations do not subject households losing categorical eligibility status to the FSP asset test.

I. INTRODUCTION

The Food Stamp Program (FSP), a major component of the nation’s “safety net,” helps low-income households achieve a healthy diet by providing them with benefits that can be redeemed for food. With relatively few non-financial eligibility criteria, the FSP is the largest domestic food and nutrition assistance program administered by the U.S. Department of Agriculture’s (USDA) Food and Nutrition Service (FNS). To ensure that the FSP is targeted to the people who most need it, Congress restricts program eligibility by imposing limits on household income and assets. In recent years, several rule changes have affected FSP asset eligibility; in addition, policymakers often consider more changes.

The research presented here provides detailed information on the effects of asset and categorical eligibility rule changes on the number and types of households eligible for the FSP. More generally, the analysis examines the effects of these changes on the degree of social equity achieved by the FSP, with implications for safety net programs in general. We use computer simulation models to estimate the effects of policy changes—some similar to changes recently considered by Congress and some recently enacted. Given that asset rules now vary across states, we also examine the number and characteristics of households eligible for the FSP under some state rules and ineligible under other state rules. The results of the research are an important addition to ongoing discussions of the role of asset limits in the FSP and other assistance programs.

We found that:

- Recent state expansions in categorical eligibility rules have substantially expanded FSP eligibility. We estimate that 7 percent of households eligible in 2006 were eligible only through state expansions in categorical eligibility. These households were eligible for 4 percent of all benefits.

- The increase in discretion accorded to states to set asset and categorical eligibility policies has increased disparities in eligibility across states. Elimination of the recent state expansions in asset and categorical eligibility rules would increase by 6 percentage points the percentage of eligible households that would be eligible in all states.
- Additional changes to FSP asset policies, some of which were made as part of the 2008 FSP reauthorization, would both increase eligibility and reduce state disparities in eligibility. Eligibility increases range from less than 1 percentage point to 22 percentage points, depending on the policy option simulated.
- The characteristics of eligible households differ under the various policy simulations. For instance, households that would become eligible under expansions to the FSP asset policy tend to have slightly higher income than currently eligible households.

In this introductory chapter, we discuss the project’s policy context, including changes to FSP eligibility rules, the questions addressed by the research, and the existing literature on which the research builds.

A. POLICY CONTEXT

Although FSP income limits have increased regularly over the years, asset limits for most households remained unchanged for over 20 years.¹ The asset test is intended to channel food assistance to the neediest households by ensuring that FSP participants do not have substantial assets that can be readily converted to cash to buy food. However, in 2002, household assets made an estimated one-fifth of income-eligible households ineligible for the FSP (Trippe and Schechter 2007), leading some policymakers to wonder whether the asset limits may exclude some truly needy households from the program. Policymakers were also concerned about some unintended consequences of the asset test; specifically, households might be discouraged from saving for retirement or college tuition or from owning a vehicle that could provide a dependable method of commuting to work because accumulating those assets may make them ineligible for

¹ An exception is the asset limit for households with a disabled member, which was raised from \$2,000 to \$3,000 in 2002.

the FSP. In addition, FSP eligibility affects eligibility for the National School Lunch Program (NSLP) and the School Breakfast Program (SBP); schoolchildren in families that participate in the FSP are categorically eligible for free meals through those programs. Restrictions on FSP eligibility could increase the paperwork needed to certify children for the NSLP and SBP and in some cases possibly even limit eligibility.

To address these concerns, Congress and many states have made several changes to the FSP asset rules; other changes are under consideration by some states. Understanding the effect that these changes have had or potentially will have on FSP eligibility will help inform the policy discussion. Below, we describe FSP eligibility rules, recent changes to the asset rules, and additional changes under discussion.

1. Food Stamp Program Eligibility

To be eligible for the FSP, most households must pass a gross income test, a net income test, and an asset test. The gross and net income limits are 130 and 100 percent of the federal poverty guidelines, respectively. Households with an elderly or disabled member are not subject to the gross income test, and categorically eligible households, described below, are not subject to either income test. A household's assets are another determinant of FSP eligibility. To be eligible under federal FSP asset rules, non-categorically eligible households without an elderly or disabled person may own no more than \$2,000 in countable assets. Non-categorically eligible households with an elderly or disabled person may own up to \$3,000 in countable assets. A household is categorically eligible for the FSP if all of its members receive benefits from Temporary Assistance for Needy Families (TANF), Supplemental Security Income (SSI), or General Assistance (GA). These so-called "pure public assistance" households are not subject to any FSP income or asset tests.

Although the value of a family home is not included in countable assets, most financial assets and some of the value of vehicle assets are countable under federal FSP rules. The federal program rules for determining the value of countable vehicle assets are complex. The value of certain vehicles is entirely excluded from countable assets, including the value of vehicles with very low equity and vehicles used as homes, to transport fuel or water, to transport a disabled person, or to produce income. (Vehicles used to commute to work do not fall under the last category). Most remaining vehicles (one per adult in the household plus one per teenager who drives to work or school) are valued at their fair market value (FMV) minus an allowance of \$4,650. Additional vehicles are valued at the higher of their FMV minus \$4,650 or their equity (FMV minus liens).

As Wemmerus (1993) points out, when the FMV threshold was established in 1977, the value of \$4,500 was chosen as the average FMV of a serviceable vehicle. At that time, \$4,500 would buy a new family sedan such as an Oldsmobile Cutlass Supreme. The current FMV threshold of \$4,650 might now buy an eight-year-old Chevy Cavalier.

Once a household is certified as eligible for the FSP, either by passing the income and asset tests or by being categorically eligible, the benefit for which it qualifies is calculated. Although one- and two-person households automatically qualify for a minimum benefit of \$10, in a few cases, larger households that are technically eligible for the FSP but have a relatively high net income may not qualify for a positive benefit. For the purposes of our research, we classify households that do not qualify for a positive benefit as ineligible for the FSP.

2. Recent Changes to Food Stamp Program Eligibility Rules

The federal government has accorded states the flexibility to set their own FSP asset policies, within certain parameters, thus allowing states to streamline eligibility certification by coordinating asset rules among programs. The changes in flexibility fall into two categories:

those that expand categorical eligibility, thereby exempting households from the FSP asset test, and those that reduce the value of vehicle assets included in countable assets.

Regulations implemented in early 2001 confer categorical eligibility on households certified as eligible to receive any state-provided benefit or service that is at least 50 percent funded by federal TANF block grant money or state Maintenance of Effort (MOE) money.² In addition, states may choose to confer categorical eligibility on the basis of benefits or services that are less than 50 percent funded by TANF/MOE money and on households in which one member receives a benefit or service that benefits the entire household as determined by the state (Wolkwitz 2007a, USDA 2007). States can effectively change the FSP asset test to which some low-income households are subject by conferring categorical eligibility through programs without an asset test, with a higher asset limit than the FSP's, or with an asset policy that differs in other ways from the FSP's asset policy.

Legislation was also enacted to give states options for counting vehicle assets. The 2001 Agricultural Appropriations Act allows states to align their FSP vehicle rules with the rules in place for certain other programs such as TANF cash benefits or TANF/MOE-funded child care assistance as long as the alternate rules are at least as generous as the federal FSP vehicle asset rules. In states that use this option, all FSP households are subject to the alternate rules.

Over the past several years, most states have used one or more of the options described above to expand FSP eligibility to a larger proportion of their low-income population. Several states operate TANF/MOE-funded programs with few, if any, eligibility restrictions and have used the programs to confer categorical eligibility on virtually all of their low-income households. Other states have extended categorical eligibility to a more select group of

² Under the TANF provisions of the Personal Responsibility and Work Opportunity Reconciliation Act of 1996, states are required to spend a certain amount of state money on benefits and services for low-income households. The required state cost-sharing is referred to as Maintenance of Effort, or MOE.

households, such as those with children. Still other states have chosen to align their FSP asset rules with more generous TANF rules. By the end of 2006, 25 states had adopted policies that exclude the value of all vehicles from the FSP asset test for almost all households. Other states exclude from countable assets the value of one vehicle per household, one vehicle per adult, or a larger amount of a vehicle's FMV. Only one state, Idaho, still used the federal FSP rules described above for all vehicles during the period covered by this report. (Appendix A presents details on state asset policies as of January 2007.)

The president's 2008 budget submission included a proposal to restrict FSP categorical eligibility for TANF recipients to those receiving cash assistance, but the proposal was not a part of either the final FY 2008 budget appropriations or the president's 2009 budget submission.

The Food, Conservation and Energy Act of 2008 made several additional changes to the FSP, including changes to asset eligibility rules. Specifically, beginning in fiscal year 2009, asset limits will be indexed to inflation, and retirement and education savings will be excluded from the asset test.

Discussions about additional changes at either the federal or state level can benefit from a detailed analysis of the likely effects of proposed policy changes on FSP eligibility and the effects of changes already enacted or forthcoming. Estimates of how many households would become newly eligible or ineligible under proposed rule changes along with the corresponding change in potential benefit costs make it possible to weigh the costs and benefits of potential policy changes. In addition, estimates of how many households became or are likely to become newly eligible or ineligible under already enacted or forthcoming changes will inform policy discussions about the advisability of rolling back some of the recent changes. Finally, an assessment of the eligibility disparities across states resulting from states' new policy-setting

flexibility sheds additional light on eligibility policies related not only to the FSP but also to other income-support programs with eligibility policies that vary by state.

B. RESEARCH OBJECTIVES

The central objective of our research is to assess the effects of recent, forthcoming, and proposed changes to FSP asset and categorical eligibility rules on FSP benefits, the characteristics of households eligible for the FSP, and the equity profile of the FSP. The research addresses the following broad questions:

1. How much did the recent vehicle and categorical eligibility policy changes expand eligibility and increase participation? How much in additional benefits is paid out as a result? What will be the effect of the recently enacted additional eligibility expansions?
2. How do households newly *eligible* under the expanded rules implemented by states compare to households eligible under the federal rules? How do *participants* eligible only under the expanded rules compare to participants eligible under the federal rules? Have some demographic or economic subgroups been more affected by the eligibility expansion than others?
3. How do the level and composition of the financial, home equity, and vehicle assets of households eligible only under the expanded rules compare with the asset holdings of households eligible under the federal rules?
4. How much does the variation in asset eligibility rules across states lead to disparities in FSP eligibility? Are some subgroups disproportionately affected?

C. PREVIOUS RESEARCH

This project builds on previous microsimulation work to estimate the effects of policy changes on the number and characteristics of households eligible for the FSP and participating in the FSP.

Most federal agencies that administer income transfer programs routinely use microsimulation models to estimate the effects of changes to program rules. In research for USDA, Mathematica Policy Research, Inc. (MPR), frequently conducts simulations to estimate the cost and distributional impact of proposed changes to the FSP. These simulations usually

address a timely policy question of concern to FNS. For each simulation, MPR typically produces a standard set of tables that provide an overview of the estimated effect of the policy change on FSP eligibility.

Microsimulation has also found application in longer-term research to estimate FSP eligibility. For instance, Wolkwitz (2007b) used a microsimulation model to estimate the denominators of the official FSP participation rates published by USDA. Wolkwitz estimates the number of eligible individuals and participating individuals along with participation rates for a variety of national economic and demographic subgroups for 1999 through 2005. According to Wolkwitz, the number of individuals eligible for the FSP increased from 2001 to 2004, at which time it leveled off. Cunyningham et al. (2007) used the same microsimulation-based estimates of eligible and participating individuals along with other data and shrinkage estimation methods to develop estimates of state FSP participation rates. They found that state participation rates varied in 2005 from just under 50 percent to over 90 percent.

Trippe and Schechter (2007) relied on an earlier version of the MATH SIPP+ model used in our research to estimate the asset holdings of low-income households in 2002. They found that, of the 20 percent of low-income households that passed the FSP income tests but failed the asset test, the majority were ineligible based on financial rather than vehicle assets. In a North Carolina demonstration project, Wemmerus and Gottlieb (1999) used microsimulation, along with other methods, to estimate the impact of relaxing the vehicle asset test on FSP eligibility, participation, and benefit costs.

Lerman and Wiseman (2002) used FSP eligibility estimates derived from the Urban Institute's Current Population Survey (CPS)-based TRIM3 model to examine the relationship between participation in the FSP and the circumstances of low-income working families. The

authors estimate that 92 percent of working families in poverty in 1998 qualified for the FSP but that only 54 percent of eligible families chose to participate.³ However, they found that, among households with similar earnings, eligible non-participating households reported less food insecurity than did participating households.

MaCurdy and Marrufu (2006) used the Monthly Income Dynamics, Survey of Income and Program Participation (MID-SIPP) model to simulate the effects of changes to the FSP's eligibility rules and certification and reporting requirements. They estimate that 49 percent of all families have less than \$2,000 in financial assets and that 61 percent have less than \$10,000 in vehicle assets. Among participating households, however, 94 percent have less than \$2,000 in financial assets and 93 percent have less than \$10,000 in vehicle assets.

The present research extends the earlier research by assembling and using updated information on state policies and by simulating additional asset and categorical eligibility policy options. We also expand the set of household characteristics examined and incorporate cross-tabulations of key characteristics. More broadly, the present analysis provides detailed information on the effects of asset limits on equity and economic efficiency in safety net programs in general. The study is therefore potentially useful for the development not only of FSP policies but also of policies governing other assistance programs.

D. ORGANIZATION OF THE REPORT

Chapter II describes the methodology used to develop the estimates presented in this report, and Chapter III presents our findings. Appendix A provides in-depth information on the microsimulation models, Appendix B presents a supplemental analysis of households that

³ For the estimates cited here, Lerman and Wiseman define a working family as a one-family household with at least one child and with annual family earnings equivalent to those of someone working full-time year-round at minimum wage.

become newly eligible under a simulation to eliminate the FSP asset test, and Appendix C discusses the ineligibility of SSI recipients for the FSP in California and how that state's policy affects our research results. Finally, Appendices D through R, found in the *Technical Appendices* to the main report, present detailed results of the simulations conducted under the project.

II. METHODOLOGY

This report draws heavily on two computer models developed for USDA by MPR to simulate the FSP: the MATH SIPP+ model and the QC Minimodel. We provide an overview of these research tools here and refer the reader to additional information in Appendix A of this report and in the following documents:

- “Technical Working Paper: Creation of the September 2002 MATH SIPP+ Microsimulation Model and Database” (Smith 2006)
- “Final Documentation of the 2006 Baseline of the 2002 MATH SIPP+ Model” (Trippe, Cunnyngham, and Poikolainen 2006)
- “Technical Documentation for the Fiscal Year 2006 FSPQC Database and QC Minimodel” (Wolkwitz and Ewell 2007)

Microsimulation models typically involve two components: an underlying database and a computer program. The database consists of records on individual households and contains detailed information about income, assets, and household demographic characteristics necessary to determine FSP eligibility. The computer programs, acting as “electronic caseworkers,” apply FSP eligibility rules to each household in the database to determine whether a household would be eligible for the program and, if so, the benefit to which the household would be entitled. The microsimulation models also predict eligible households’ participation in the FSP. We used the microsimulation models to simulate proposed policy changes, to tabulate the number and characteristics of eligible and participating households under the proposed policy changes, and to compare the results of the various simulations to the number and characteristics of eligible and participating households under the rules in place in 2006. We also used the MATH SIPP+ model to compare variations in FSP eligibility across states.

This section describes the data used in the microsimulation models, provides an overview of the computer programming, and discusses the policy changes simulated under the project.

A. DATA

The quality of the underlying database is essential to an accurate estimate of the effects of changes in FSP policy. However, no single data source has both the information needed to simulate FSP eligibility and a sample large enough to produce meaningful state estimates. The primary model in our research, the MATH SIPP+ model, uses the Survey of Income and Program Participation (SIPP) as an underlying database and incorporates state controls extracted from the CPS, thus drawing on the strengths of both databases. The QC Minimodel operates on FSP quality control data, which are also used to calibrate the MATH SIPP+ model so that estimates of the number and characteristics of participating FSP households are similar to administrative data. Finally, we collected detailed data on state asset and categorical eligibility rules for use in updating the MATH SIPP+ model. We briefly describe the relevant data.

1. Survey of Income and Program Participation

SIPP is a nationally representative survey conducted by the Census Bureau that collects detailed monthly information on household composition, income, assets, expenses, and participation in various government programs such as the FSP. The SIPP database contains rich information on important determinants of FSP eligibility and thus is useful for an FSP microsimulation model.

The underlying data set for the MATH SIPP+ model is households in the SIPP universe in September 2002 as contained in the Wave 6 Core file of the 2001 SIPP Panel, a sample of 26,498 households. The model also incorporates data on citizenship from the Wave 2 Topical Module file and data on living expenses and asset holdings from the Wave 6 Topical Module file. For

this project, we incorporated data on household food security in the summer of 2003 from the Wave 8 Topical Module file, as well.

Asset data available from the SIPP includes home equity, vehicle equity, equity in interest-earning accounts, equity in stocks, equity in IRA and KEOGH accounts, equity in 401K and Thrift savings accounts, and equity in other assets. Because retirement assets are reported separately from other assets, we are able to simulate excluding them from FSP countable assets. However, education savings accounts are not reported separately, so we are not able to use the MATH SIPP+ model to simulate changes to FSP asset rules involving education assets.

2. Current Population Survey Annual Social and Economic Supplement

While the SIPP sample contains important data on household income, assets, and expenses, it is a relatively small sample; in fact, it is so small that it identifies households in several states as being in a group of states rather than in a specific state. The much larger CPS is conducted monthly by the Census Bureau for the Bureau of Labor Statistics, and is the federal government's official source of statistics on employment, unemployment, and annual poverty rates. The Annual Social and Economic Supplement (ASEC), a supplement to the CPS, collects detailed household income data from approximately 80,000 households but does not collect information on household assets and therefore is not by itself an appropriate data set for this project. The CPS, however, is representative at the state level and is a useful source of data on state distributions of household characteristics. To enable us to use the MATH SIPP+ model for state tabulations, we used data from the 2002 and 2003 CPS ASEC during model development to re-weight the SIPP to match the distribution of demographic characteristics of the U.S. population by state.

3. FSP Quality Control Data

Administrative data generated annually from the FSP's Quality Control system (FSPQC) are an excellent source of information on the characteristics of FSP participants. This data set contains the information needed to determine whether a household is eligible for the FSP and to calculate the benefit for which the household qualifies, including detailed information on household income, expenses, and demographics. Because the quality control system only records data on assets that count toward the FSP asset limits, only limited information on household asset holdings is available.

Each year, MPR uses these data to create an FSPQC datafile for tabulations and a QC Minimodel for simulating policy changes. For this project, we used the FY 2006 QC Minimodel, which has a sample of 45,734 households, to simulate two policy changes.

The FSPQC data is also used in the MATH SIPP+ model development. In the present research, we calibrated the number and characteristics of FSP participants on the updated MATH SIPP+ model to match adjusted 2006 program operations totals and characteristic distributions from the FY 2005 FSPQC datafile, the most recent FSPQC datafile available at the time.

4. Data on State Asset Rules

An essential component of the project was the compilation of a detailed database of current state asset and categorical eligibility policies. The availability of such information allowed us to simulate the various rules in place in each state and thus accurately estimate the effects of rule changes.

We began our data compilation with a report on state FSP vehicle asset policies prepared by the Center on Budget and Policy Priorities (CBPP 2006). To clarify certain policies and to obtain the detail needed to simulate state policies, we augmented CBPP's summary with data

from states' online FSP manuals and occasionally by contacting a state for clarification. Table A.2 of Appendix A summarizes the state policies simulated in the MATH SIPP+ model.

B. MICROSIMULATION MODELS

Developing computer models to simulate the FSP is a lengthy and complex process. In this section, we summarize the major components of the MATH SIPP+ model and the QC Minimodel; Appendix A provides additional details, including the asset and eligibility rules simulated in the MATH SIPP+ model.

1. Overview of MATH SIPP+ Model

The September 2007 version of the 2006 Baseline of the 2002 MATH SIPP+ model, which is the version of the MATH SIPP+ model employed in this research, uses FY 2006 values for income and asset thresholds, maximum benefits, and deductions and simulates federal and state asset and categorical eligibility rules as of January 2007. Because the model is based on September 2002 data, the parameter values are deflated from September 2006 dollars to September 2002 dollars. Rather than simply applying FSP eligibility rules to reported households or families, the model first divides household members into FSP units according to FSP rules about who must apply for the FSP together.

To help interpret some of our simulation results, we have organized the 50 states and the District of Columbia into three broad categories (Table II.1.) The first category, which consists of 11 states, is made up of states in which most low-income households are categorically eligible for the FSP and therefore not subject to asset or income tests. The second category contains the 29 states in which most households are not categorically eligible but most vehicles are excluded from the asset test. Finally, the third group is made up of the 11 states in which many households are subject to the federal FSP asset and income tests and some vehicles are counted toward asset limits.

TABLE II.1

STATES GROUPED BY ASSET AND CATEGORICAL ELIGIBILITY POLICIES

States	Delaware Maine Maryland Massachusetts Michigan Minnesota North Dakota Oregon South Carolina Texas Wisconsin	Alabama Alaska Arizona California Colorado District of Columbia Georgia Hawaii Indiana Kansas Kentucky Louisiana Mississippi Missouri Montana	New Hampshire New Mexico New York North Carolina Ohio Oklahoma Rhode Island South Dakota Tennessee Utah Vermont Virginia Washington West Virginia	Arkansas Connecticut Florida Idaho Illinois Iowa Nebraska Nevada New Jersey Pennsylvania Wyoming

Because the SIPP underreports program participation, the MATH SIPP+ model simulates both TANF and SSI receipt. Identifying the correct number of SSI recipients is particularly important to FSP eligibility determination in California because of a state policy, known as “SSI cash-out”, that makes SSI recipients in California categorically ineligible for the FSP. California has a relatively high SSI state supplement such that, under standard FSP rules, many (though not all) SSI recipients would be eligible for only the minimum benefit of \$10 per month. When California implemented its SSI cash-out policy, it simultaneously increased the SSI state supplement by \$10 to substitute for FSP benefits. California’s SSI cash-out policy affects some non-SSI recipients. Californians who live with SSI recipients but who do not themselves receive SSI may apply for the FSP. In some cases, households that would not qualify for the FSP if

household members who receive SSI were part of the FSP unit are eligible for the FSP when SSI recipients are excluded from the FSP unit. Later, we discuss the effect of California's SSI cash-out policy on our research results.

The MATH SIPP+ model uses an algorithm to select participants from the pool of households simulated to be eligible. The algorithm incorporates caseload and characteristic targets derived from the FSPQC datafile to ensure that the baseline simulated participant population is similar to the participant population in the administrative data. When a household becomes newly eligible under a simulated policy change, a logit equation based on the baseline simulated participant population predicts whether the household will participate.

Each observation in the MATH SIPP+ model contains a set of 51 household weights (state weights); each of the 51 weights designates the number of households that the sample household represents in a particular state and the District of Columbia. The state weights are created using a small area estimation methodology developed and evaluated by Schirm and Zaslavsky (2001).

Using the methodology, we “borrow strength” from observations in other states by allowing each sample household to represent households in each state rather than just the state in which the household resides. The intuition posits that even if a state has only a relatively small number of observations in the data file, there are likely to be many observations on households with characteristics similar to those of households in the state of interest, and these observations from other states can provide information about the likely circumstances of households in the initial state of interest. Thus we can “borrow strength” from observations in other states when analyzing the initial state. Analysis presented in Schirm and Zaslavsky demonstrates that this methodology can substantially improve the accuracy of estimates for a given state.

In operationalizing this approach, a regression model is used to construct the appropriate weights, based on simultaneous analysis of multiple household characteristics. We used a set of

33 national population control totals from the SIPP and state distributions of these control totals as reported in the CPS. The sum of a household's 51 state weights equals the household's original SIPP weight, and the sum of a state's weights over all households equals the state's target population total.

Using methodology recommended by the U.S. Census Bureau for users of SIPP data, we calculated standard errors for the MATH SIPP+ estimates of eligible and participating households and for the change in estimates resulting from simulated changes to FSP eligibility rules. Appendix A briefly describes the methodology employed and presents a table with 90-percent confidence intervals, constructed from the calculated standard errors, for selected point estimates. In addition, tables in this report that show the estimated change in eligible households and their characteristics resulting from simulated changes in FSP eligibility rules include indicators of statistical significance.

2. Creation of FSPQC Datafile and QC Minimodel

To create the FSPQC datafile and QC Minimodel, MPR begins with administrative data from the FSP's quality control system. Observations that were not subject to review, were incomplete, or had review findings of ineligible are dropped from the file, and the remaining observations are edited for internal consistency. Among other things, the file development routines ensure that a household's gross income minus total deductions equals net income and that a household's benefit amount equals the maximum benefit for the household's size minus 30 percent of the household's net income. The file development programs also construct several variables from the administrative data, including household-level income type totals and characteristic flags and counts.

The FSPQC datafile and QC Minimodel are weighted so that the number of households, individuals, and benefits match adjusted FSP program operations totals by state and month. The

program operations data are adjusted to remove benefits issued through the FSP disaster assistance program and benefits issued in error, along with FSP households and individuals receiving such benefits because they are not included in the quality control data.

We use the QC Minimodel to estimate the effects of policies that would restrict eligibility. Given that the quality control data are limited to current participants, we do not use the model to simulate possible eligibility expansions. With the data including a flag for categorically eligible households as well as information on public assistance cash benefits received, we are able to identify households that are categorically eligible through the receipt of non-cash benefits, a group that we are unable to identify by using SIPP data.

C. SIMULATED POLICIES

For this research, we simulated 15 policy scenarios, described below, that fall into 6 categories (Table II.2). We conducted the first 4 sets of simulations with the MATH SIPP+ model and the last 2 sets with the QC Minimodel.

TABLE II.2

Under this simulation, pure PA households remain categorically eligible but all other households need to pass the applicable state or federal FSP asset and income tests.</p>

TABLE II.2 (continued)

Revert to Standard Federal FSP Asset Rules and Eliminate Categorical Eligibility for Non-Pure Public Assistance Households

Under this simulation, all non-pure PA households are subject to the federal FSP asset rules and must pass the appropriate income tests.

Simulations to Change Asset Limits

Increase Asset Limits by \$1,000, \$2,000, \$3,000 and \$4,000

The federal FSP asset limits are \$2,000 for most households and \$3,000 for households with an elderly or disabled member. Under these four simulations, the asset limits are increased, respectively, to \$3,000, \$4,000, \$5,000, and \$6,000 for most households and 4,000, \$5,000, \$6,000, and \$7,000 for households with an elderly or disabled member. These simulations have a lesser or no effect in the six states that already have higher or no asset limits.

Eliminate the Asset Test

This simulation eliminates the asset test altogether. Non-categorically eligible households must still pass the applicable income tests and qualify for a positive benefit.

Simulations to Change Countable Assets

Exclude Assets in Retirement Accounts from Countable Assets

Under this simulation, assets in IRA or Keogh accounts are excluded from the asset test.

Exclude All Vehicles from Countable Assets

Under this simulation, none of a household's vehicles count towards the FSP asset limits.

Exclude One Vehicle per Driver from Countable Assets for States with Less Generous Rules

Under this simulation, one vehicle for each adult in the household and one for each teenager of driving age who is either working or in school does not count towards the FSP asset limits. This simulation has no effect in states with more generous asset rules.

Baseline in the FY 2006 QC Minimodel

2006 FSP Rules

Baseline in the FY 2006 QC Minimodel simulates FY 2006 rules and parameters. The underlying administrative data contains limited asset data, but does include categorical eligibility and pure public assistance flags as well public assistance income received.

Simulations to Eliminate State Expansions in Categorical Eligibility Using the QC Minimodel

Eliminate Categorical Eligibility for Non-Pure Public Assistance Households

Under this simulation, pure PA households remain categorically eligible but all other households must pass the appropriate income tests. This simulation is similar to the second simulation we conducted with the MATH SIPP+ model, but because the QC Minimodel contains limited asset data, we cannot determine whether categorically eligible households would pass the asset test.

Eliminate Categorical Eligibility for Non-Pure Public Assistance Households Receiving Only Non-Cash Benefits

This simulation is similar to the simulation above, except categorical eligibility is eliminated only for those non-pure PA household who are receiving a service rather than cash benefits. We are able to identify households that are categorically eligible for the FSP through the receipt of non-cash benefits using data on cash public assistance benefits received and a flag that indicates categorical eligibility.

It is important to note that the statistical estimates presented in this report will vary slightly from official USDA estimates, both because of differences in the time periods to which the estimates apply, and because of minor modeling adjustments made for purposes of this report.

1. Eligibility in Fiscal Year 2006

2006 FSP Rules. In much of our analysis, it will be useful to compare simulated changes in policy to a “baseline” that reflects the current FSP. The baseline values used in our research are produced by the most recent update of the MATH SIPP+ model, which incorporates FY 2006 values for income and asset thresholds, maximum benefits, and deductions and then simulates federal and state asset and categorical eligibility rules as of January 2007.

2. Simulations to Eliminate State Expansions in Asset and Categorical Eligibility

As of January 2007, all states except Idaho had established state-specific FSP asset and categorical eligibility policies. The three simulations described below estimate the effect of those recent state policy changes by simulating a reversion from state policies to the more restrictive federal policies described in Section I.A.1. The first simulation involves state asset rules, the second involves state categorical eligibility rules, and the third involves both the state asset and categorical eligibility rules.

Revert to Standard Federal FSP Asset Rules for Non-Categorically Eligible Households. States currently have the option of aligning their FSP asset rules with the rules for a TANF-funded program if the TANF rules are more generous than the federal FSP asset rules. Under this simulation, all households not categorically eligible under either federal or state policies are subject to the more stringent federal FSP asset rules.

Eliminate Categorical Eligibility for Non-Pure Public Assistance Households. Categorically eligible households are not subject to income or asset limits. Pure public assistance (PA) households, in which every member receives SSI, cash TANF, or GA, have

traditionally been categorically eligible. Currently, non-pure PA households certified to receive certain TANF/MOE-funded benefits or services may also be categorically eligible. Under this simulation, pure PA households remain categorically eligible, but all other households need to pass applicable state or federal FSP asset and income tests.

Revert to Standard Federal FSP Asset Rules and Eliminate Categorical Eligibility for Non-Pure Public Assistance Households. Under this simulation, which combines the two simulations described above, all non-pure PA households are subject to the federal FSP asset rules and must pass the appropriate income tests.

3. Simulations to Change Asset Limits

The following five simulations change the federal FSP asset limits. The first four incrementally increase the asset limits and the last one eliminates the asset test altogether.

Increase Asset Limits by \$1,000, \$2,000, \$3,000, and \$4,000. The federal FSP asset limits are \$2,000 for most households and \$3,000 for households with an elderly or disabled member. Under the four simulations, the asset limits increase, respectively, to \$3,000, \$4,000, \$5,000, and \$6,000 for most households and to \$4,000, \$5,000, \$6,000, and \$7,000 for households with an elderly or disabled member. The simulations have a lesser or no effect in the six states that already have higher or no asset limits. (See Table A.2 for information about state asset limits.)

Eliminate the Asset Test. This simulation eliminates the asset test altogether. Non-categorically eligible households must still pass applicable income tests and, for the purposes of our research, qualify for a positive benefit.

4. Simulations to Change Countable Assets

The final three simulations conducted in the MATH SIPP+ model exclude certain types of assets from counting toward the FSP asset limits. However, we were not able to simulate the

effect of excluding education savings accounts from countable assets because the SIPP data do not contain the necessary information.

Exclude Assets in Retirement Accounts from Countable Assets. Currently, assets in IRA or Keogh accounts count toward the FSP asset limits. Under this simulation, those retirement assets are excluded from the asset test as they will be beginning in fiscal year 2009.

Exclude All Vehicles from Countable Assets. Under this simulation, none of a household's vehicles counts toward the FSP asset limits. Currently, 25 states already exclude all vehicles from countable assets and additional states have expanded categorical eligibility to cover most low-income households. Households in those states are unaffected by this policy change.

Exclude One Vehicle per Driver from Countable Assets for States with Less Generous Rules. Under this simulation, one vehicle for each adult in the household and one for each teenager of driving age who is either working or in school does not count toward the FSP asset limits. This simulation has no effect in the many states with identical or more generous asset rules.

5. Fiscal Year 2006 Participants

2006 FSP Rules. We used the baseline of the FY 2006 QC Minimodel to examine the characteristics of FSP participants in 2006. Based on FSP administrative data, the model uses FY 2006 rules and parameters. The underlying administrative data contain limited asset data but include more data on categorical eligibility than does the MATH SIPP+ model.

6. Simulations to Eliminate State Expansions in Categorical Eligibility Using the QC Minimodel

Eliminate Categorical Eligibility for Non-Pure Public Assistance Households. Under this simulation, pure PA households remain categorically eligible, but all other households must pass the appropriate income tests. This simulation is similar to the second simulation we conducted

with the MATH SIPP+ model, with two differences. First, the QC Minimodel contains a flag that indicates categorical eligibility, so we are better able to identify categorically eligible households. Second, the QC Minimodel contains limited asset data, so we cannot determine whether categorically eligible households would pass the asset test.

Eliminate Categorical Eligibility for Non-Pure Public Assistance Households Receiving Only Non-Cash Benefits. This simulation is similar to the categorical eligibility simulation described above, except that it eliminates categorical eligibility only for those non-pure PA household that are receiving a service rather than cash benefits. We are able to identify households that are categorically eligible for the FSP through the receipt of noncash benefits using data on cash public assistance benefits received and a flag that indicates categorical eligibility.

III. FINDINGS

In this chapter, we present the results of our research. Section A describes the characteristics of households that were eligible for and participating in the FSP in 2006 based on estimates from the MATH SIPP+ model. Section B discusses the effects of simulated policy changes on the number and characteristics of eligible households. Section C continues the discussion on the effect of simulated policy changes by presenting “eligibility rates,” or the percentage of low-income households eligible for the FSP under various policy options. Section D examines how eligibility varies across states in the 2006 baseline and under the simulated policy changes. Finally, Section E describes the characteristics of households that participated in 2006, based on estimates from the QC Minimodel, and discusses the effect of two policy changes simulated in that model.

A. CHARACTERISTICS OF HOUSEHOLDS ELIGIBLE FOR THE FOOD STAMP PROGRAM IN 2006

According to estimates from the MATH SIPP+ model, an estimated 20.5 million households were eligible for the FSP in an average month in FY 2006, and an estimated 11.5 million of these households chose to participate (Table III.1).¹ We briefly describe the characteristics of these households; Appendix D, in the *Technical Appendices* to the main report, presents detailed tables with additional information.

¹ The MATH SIPP+ model simulates FSP participation because program participation is underreported in the SIPP. Although the simulated FSP participant population is calibrated to closely match administrative data on participating households, the simulated estimates differ slightly from estimates derived from the administrative data-based QC Minimodel. They are presented here to facilitate a comparison between the characteristics of eligible and participating households. Appendix A includes information on how the MATH SIPP+ model selects participating households from among eligible households.

Source: 2006 Baseline of 2002 MATH SIPP+ model, September 2007 update

Households eligible for the FSP in 2006 were likely to be in poverty. Of the 20.5 million eligible households, 68 percent had gross income at or below the federal poverty level for their household size, and less than 1 percent had gross income greater than 200 percent of poverty.

Among eligible households with any income, the average monthly gross income was \$966 (Table III.2). Eligible households that chose to participate were poorer, on average, than all eligible households. Of the 11.5 million participating households, 84 percent were in poverty, and the average monthly gross income among those with income was \$818. The average monthly benefit for which eligible households and participating households qualified was \$160 and \$211, respectively. Eligible households qualified for a total of \$3.3 billion in benefits in an average month and participating households qualified for \$2.4 billion (Table III.3, below, and Table D.3, in the *Technical Appendices* to the main report).

TABLE III.2

AVERAGE POTENTIAL MONTHLY BENEFIT, AVERAGE MONTHLY INCOME, AND AVERAGE ASSETS AMONG HOUSEHOLDS ELIGIBLE FOR THE FOOD STAMP PROGRAM IN 2006

Source: 2006 Baseline of 2002 MATH SIPP+ model, September 2007 update

Most eligible households had some type of income, although 11 percent of eligible households reported no cash income. The most prevalent income sources for eligible households

were earned income, received by 40 percent of eligible households; Social Security, received by 31 percent; and SSI, received by 18 percent. Only 8 percent of eligible households in 2006 received cash TANF benefits. Participating households were less likely than all eligible households to have earnings (35 percent) and to receive Social Security (21 percent) and more likely to receive TANF (12 percent) or SSI (21 percent). Among FSP-eligible households with earnings, average monthly earnings were \$1,049; among FSP-eligible households receiving cash TANF benefits, the average monthly TANF benefit was \$367. Average monthly earnings among participating households with earnings were slightly lower at \$923, and the average cash TANF benefit among participating households receiving TANF was slightly higher at \$371.

Eligible and participating households tended to have relatively few countable assets. Assets that are not countable under state rules include those owned by TANF and SSI recipients and by other households that are categorically eligible under state rules. In addition, non-countable vehicle assets include the value, or in some cases the partial value, of vehicles not counted under federal or state vehicle rules. Non-countable financial assets include rental assets, life insurance, and 401K accounts. Almost half of eligible households owned at least one vehicle, but less than 1 percent owned vehicles that were countable under state FSP rules. The average total value of vehicle assets among eligible households that owned a vehicle was \$2,378; the total average value of vehicle assets countable under state FSP eligibility rules was \$1,248. Participating households were slightly less likely to own a vehicle (43 percent), but the average value of their countable vehicles was slightly higher (\$1,418). Forty-nine percent of eligible households had financial assets, 22 percent had countable assets, and 26 percent owned a home as compared to 41, 18, and 19 percent, respectively, of participating households.

Most eligible households include children, elderly adults, or disabled nonelderly adults. In 2006, 41 percent of all eligible households included children, 29 percent included elderly

members, and 15 percent included a disabled nonelderly adult. Participating households were more likely to include children (49 percent) and less likely to include elderly adults (18 percent.)

The MATH SIPP+ model contains data on the food security status of 88 percent of all FSP-eligible households and 87 percent of participating households. Nineteen percent of all eligible households reported low or very low food security as did 21 percent of participating households.

B. FOOD STAMP PROGRAM ELIGIBILITY UNDER SIMULATED CHANGES TO FEDERAL AND STATE ASSET POLICIES

Changes to FSP eligibility policies affect both the number of eligible households and, given that policy changes often affect some household types more than others, the characteristics of eligible households. To estimate the effects of changes to FSP rules, we used the MATH SIPP+ model to simulate three policies that eliminate the recent expansions in state asset and categorical eligibility rules, five policies that increase or eliminate the asset limits, and three policies that exclude certain types of assets from countable assets. In addition, we used the QC Minimodel to simulate two changes to categorical eligibility rules—one similar to the policy change simulated in the MATH SIPP+ model and one that takes advantage of additional data on the QC Minimodel to simulate a more detailed categorical eligibility policy change.

As the next series of tables show, all 11 policy changes simulated in the MATH SIPP+ model resulted in statistically significant changes in eligibility, although the degree of change ranged from less than 1 percent under the simulation to revert to federal FSP asset rules to 22 percent under the simulation to eliminate the asset test. Both of the simulations conducted in the QC Minimodel showed statistically significant changes in participation of around 1 percent.

In this section, we describe the effects of the simulations conducted in the MATH SIPP+ model on the number and characteristics of eligible households. Section III.E discusses the results of the simulations conducted in the QC Minimodel.

1. Eligibility under Simulations to Eliminate State Expansions in Asset and Categorical Eligibility

To estimate the extent to which previously enacted state eligibility expansions have increased eligibility, we simulated a return to previous rules (Table III.3). Specifically, we simulated (1) a reversion to federal FSP asset rules, (2) an elimination of expanded categorical eligibility rules, and (3) a combination of the two. We found that if non-categorically eligible households were required to pass the federal FSP asset test using standard rules for counting the value of vehicles rather than state-specific rules, the number of eligible households would drop by 1 percent from 20.5 million households to 20.4 million households. If categorical eligibility were limited to pure PA households but state asset policies in effect in 2006 were retained, the number of eligible households would drop by 7 percent. A combination of the two simulations, or reversion to the asset and categorical eligibility rules that were in place at the turn of the century, would result in an 8 percent drop in the number of eligible households.

* Change is statistically different from zero at a 90% level of significance

** Change is statistically different from zero at a 95% level of significance

*** Change is statistically different from zero at a 99% level of significance

The corresponding drops in potential monthly benefits to eligible households from a baseline estimate of \$3.3 billion are 1 percent under the simulation to revert to federal FSP asset rules, 4 percent under the simulation to eliminate expanded categorical eligibility, and 5 percent under the combined simulations. The decrease in potential benefits is less than the decrease in the number of eligible households for the two simulations that eliminate expanded categorical eligibility. The reason for this is that households eligible only under expanded categorical eligibility rules tend to have higher income than households that pass the income and asset tests; the former therefore qualify for lower benefits.

The disproportionate effect that eliminating categorical eligibility has on eligible households at the upper end of the income distribution is illustrated in the first panel of numbers in Table III.4, which presents the characteristics of eligible households under the three simulations to eliminate state expansions in asset and categorical eligibility rules.² Eliminating expanded categorical eligibility reduces by over 50 percent the number of eligible households with income between 131 and 200 percent of poverty but reduces the number of eligible households in poverty by only 2 percent.

The effects also vary by households' income sources and assets. Households with earnings are slightly more likely than all eligible households to lose eligibility under the simulation to eliminate expanded categorical eligibility, as are households with Social Security (Table III.4). Households receiving TANF and SSI are only minimally affected by this simulation; many of these households are pure PA or have relatively low income and therefore would remain eligible. Although the number of eligible households with assets would drop by 11 to 15 percent with the

² Appendices E, F, and G, in the *Technical Appendices* to the main report, include detailed tables with results of the three simulations.

elimination of expanded categorical eligibility, the effect is less pronounced than the effect on households with slightly higher income discussed above.

If the state expansions in categorical eligibility were eliminated, the number of eligible households with elderly members would drop by 9 percent, slightly more than the overall decline, and the number with children would drop by 7 percent, slightly less than the overall decline. Similarly, the percentage of households reporting food security would drop by 9 percent and the percentage reporting low or very low food security would drop by less than 4 percent. Under the simulation to revert to federal FSP asset rules, the number of households with children would drop by slightly more than the overall decline and households with elderly members by slightly less.

From these simulations, we can infer that the recent state expansions in asset and categorical eligibility rules led to an estimated 1.7 million additional eligible households, with most of the increase in eligibility resulting from expanded categorical eligibility policies. If all the newly eligible households had chosen to participate in the FSP, the benefit cost would have averaged \$157 million per month. The actual increase in benefits due to expanded state eligibility policies was less because not all newly eligible households chose to participate (Table G.3 in the *Technical Appendices* to the main report).

The households that became eligible under these state expansions tended to have higher income than those eligible under federal FSP rules, although still below 200 percent of poverty, and were more likely to have assets. Referring to Table III.1, we see that these types of households are less likely to participate than households with lower income or no assets. (While 9 percent of eligible households had income between 131 and 200 percent of poverty, only 3 percent of participating households had income in this range.) Although households that became newly eligible under the state expansions tend on average to be slightly better off than households eligible under the federal FSP rules, eliminating the combined state expansions would cause some households reporting low or very low food security to become ineligible.

2. Eligibility under Simulations to Change Asset Limits

As part of the 2008 FSP reauthorization, Congress has scheduled the FSP asset limits to be indexed to inflation beginning in fiscal year 2009. Given the relatively small sample size of the underlying SIPP data in the MATH SIPP+ model, we are unable to estimate accurately the impact of such a small change in the asset limits. However, by simulating larger changes to the asset limits, we are able to infer the effects of smaller changes. To this end, by increasing the asset limits by \$1,000, \$2,000, \$3,000, and \$4,000, we estimated the effects of increasing the amount of countable assets that non-categorically eligible households could own. (Categorically eligible households are not subject to the asset test and so are not affected by these simulations.) We found that, under these four simulations, the number of eligible households rose by 2, 3, 4, and 5 percent, respectively (Table III.5). The amount of benefits for which they would qualify rose by similar percentages for the first three simulations and by slightly less for the last simulation.

Although each incremental increase in the asset limit resulted in an increase in benefits to eligible households, the size of the increases in benefits became smaller as the asset limit became larger. The difference in potential benefits between the baseline simulation and the simulation to increase asset limits by \$1,000 was \$36 million compared to a \$19 million difference in potential benefits between the simulations to increase asset limits by \$3,000 and \$4,000 (second column from the right).

Despite the lessening effect of incremental increases to the asset limit, eliminating the asset test altogether would have a large effect on FSP eligibility. Our simulation predicts that, in the absence of an FSP asset test, the number of eligible households would increase by 22 percent, and the amount of benefits for which eligible households would qualify by 20 percent. These results are consistent with Trippe and Schechter's (2007) finding that the median asset holdings

of households that were income-eligible for the FSP in 2002 but ineligible due to financial assets was \$26,000.

*** Change is statistically different from zero at a 99% level of significance

We conducted a supplemental analysis, presented in Appendix B, of the level of asset holdings of income-eligible households, focusing on households that would not become eligible under a \$4,000 increase in asset limits but would become eligible if the asset test were eliminated as well as households eligible under expanded categorical eligibility rules and with assets over \$7,000. We found that a large majority of income-eligible households, those that either pass or are not subject to the income tests, have low levels of countable assets. However, over 5 percent have more than \$50,000 in countable assets. As shown in Appendix B, Table B.3, 17 percent of income-eligible households have between \$1 and \$2,000 in countable assets, and an additional 2 percent have between \$2,001 and \$3,000 in countable assets. Together, these two groups

account for over half of all income-eligible households with countable assets. As expected, the number of households at each level of countable assets slowly decreases as the asset levels increase. Among households that are income eligible for the FSP but have at least \$7,000 in countable assets and fail the asset test, 61 percent have an elderly member, less than half are in poverty, and 84 percent have investment income. Very few such households have countable vehicle assets, while virtually all have countable financial assets.

Table III.6 presents characteristics of eligible households under the simulations to increase the asset limits by \$1,000, increase the asset limits by \$4,000, and eliminate the asset test altogether.³ As with the simulations to eliminate state expansions in categorical eligibility, the simulations to increase the asset limit have a larger effect on households with income slightly above poverty than on households in poverty. However, the difference in effects on households with different income levels is much smaller than for the previous set of simulations. For instance, a \$1,000 increase in the asset test would increase the number of eligible households in poverty by 1 percent and the number of households with income between 101 and 130 percent of poverty by 3 percent.

Eliminating the asset test altogether has a more pronounced effect on households with incomes above poverty. This policy change would increase the number of eligible households in poverty by 16 percent, the number with income between 101 and 130 percent of poverty by 26 percent, and the number with income between 131 and 200 percent of poverty by 44 percent, twice the increase for all households.

³ Appendices H through L, in the *Technical Appendices* to the main report, present detailed tables showing the results of the three simulations as well as the simulations to increase the asset limits by \$2,000 and \$3,000.

** Change is statistically different from zero at a 95% level of significance

*** Change is statistically different from zero at a 99% level of significance

As with the previous set of simulations, these policy changes would only minimally affect households receiving TANF or SSI because, under federal rules, the assets of household

members who receive public assistance are not counted toward the asset limit. However, households with income from Social Security benefit from these policy changes more than the average household. In particular, the number of households with Social Security increases by 35 percent under the simulation to eliminate the asset test.

Households with countable assets are the obvious beneficiaries of the reforms—raising the asset limits by \$1,000 would increase the numbers of households both with financial assets and with vehicle assets by 3 percent. Raising the asset limits by \$4,000 would increase those numbers by 10 and 7 percent, respectively, and eliminating the asset test would increase them by 44 and 34 percent, respectively.

Households with elderly members are more likely than the average household to become eligible under these asset limit simulations. The simulation to raise asset limits by \$1,000 would increase the number of eligible households with elderly members by 3 percent as compared to an increase for all households of 2 percent and this group increases by 42 percent under the simulation to eliminate the asset test.

Most of the increase in eligibility under these simulations would occur among households that report food security, although the number of households reporting low or very low food security would also increase slightly.

While raising the asset limits from \$2,000 and \$3,000 to \$6,000 and \$7,000 (an increase of \$4,000) would increase the number of eligible households by fewer than 1 million, eliminating the asset test altogether would make an additional 4.4 million households eligible for the FSP. The increase in average monthly benefits for eligible households would range from 2 to 4 percent for the simulations to increase the asset limits; eliminating the asset test altogether would increase potential benefit costs by 20 percent. The households that would become eligible under increases to the asset limits are more likely on average to have gross income slightly above the poverty level, to have assets, to include elderly members, and to be food-secure.

3. Eligibility under Simulations to Change Countable Assets

Some policymakers are interested in a more focused approach to expanding asset eligibility, preferring to exclude certain assets from being counted toward the asset limits rather than simply raising asset limits. For instance, the Food, Conservation and Energy Act of 2008 excludes education accounts and retirement accounts from countable assets effective fiscal year 2009 to encourage households to save for education and retirement. In addition, given that so many states exclude some or all vehicles from the asset test, policymakers are interested in the effect of the federal government's exclusion of either additional vehicles or all vehicles so that FSP recipients could own dependable transportation regardless of state of residence. While the SIPP data do not include the necessary information on education savings accounts, we were able to simulate the exclusion from the asset test of retirement assets, of additional vehicles, and of all vehicles.

Similar to the simulation to increase the asset limits by \$1,000, the simulation to exclude retirement savings from the asset test results in 2 percent increases in the number of eligible households and the amount of benefits for which they qualify (Table III.7).

The exclusion of additional or all vehicles from countable assets has a relatively small effect on the number of eligible households—less than half a percent under the simulation to exclude all vehicles and an even smaller effect when one vehicle per driver is excluded. One reason for the small effect is that state policies already exclude many vehicles. However, even when we add the number of households that are eligible because of expanded state asset rules (179,000 households, top of the second column in Table III.3) to the number that would be newly eligible if all vehicles were excluded from the asset test (52,000 households, middle of the second column of numbers in Table III.7), the cumulative effect of state asset rule expansions is a mere 1 percent increase in eligibility.

Table III.8 presents the characteristics of eligible households under the three simulations to change countable assets.⁴ The simulation to exclude retirement accounts from countable assets increases by 3 percent the number of eligible households with income between 131 and 200 percent as compared to an increase of 1 percent for eligible households in poverty. The simulation produces virtually no increase in the number of eligible households receiving TANF or SSI, although the number of eligible households receiving Social Security increases by 2 percent and the number with earnings increases by 1 percent. Not surprisingly, the simulation to exclude financial assets in retirement accounts increases the number of eligible households with financial assets by more than twice the overall increase—4 versus 2 percent for all eligible households. The number of eligible households with vehicle assets and the number that own a

⁴Appendices M, N, and O, in the *Technical Appendices* to the main report, present detailed tables with the results of the three simulations.

home also increase by higher percentages than all eligible households, rising by 3 and 4 percent, respectively.

*** Change is statistically different from zero at a 99% level of significance

The simulation to exclude retirement assets from countable assets favors households with elderly members, whose eligible numbers rise by 3 percent, versus households with children, whose eligible numbers rise by only 1 percent. Because households with elderly members tend to participate in the FSP at relatively low rates, the estimated increase in the number of these households who would become eligible under this simulation and *choose to participate* is only 2 percent (Table M.1 in the *Technical Appendices*.) The simulation has a minimal effect on the eligibility of households reporting low or very low food security.

Overall, the more focused policy options that exclude some assets from countable assets have less effect on eligibility than the policy options that raise asset limits by more than \$1,000. Fewer than 500,000 households would become newly eligible under the simulation to exclude retirement assets from countable assets, at an average monthly benefit cost of \$57 million if all chose to participate.

4. Possible Behavioral Responses to Changes to Asset Policies

Given that the MATH SIPP+ model is a static model, the estimates we present here do not incorporate potential changes to asset holdings that households may make in response to changes in FSP asset policies. Nonetheless, it is important to recognize that changes in eligibility criteria could influence households' assets holdings. An example is a rule change that eliminates the counting of retirement assets toward the FSP asset limit but continues to require other savings to be counted toward the limit. In this case, a household with savings over the FSP asset limit might decide to transfer enough regular savings to a retirement savings account to become eligible for the FSP. In this section, we discuss the possible effects of such behavioral responses to policy changes on asset holdings and how they may affect the estimates presented here.

A substantial and growing body of empirical literature examines the effects of transfer program asset limits on asset holdings by low-income households, particularly low-income

households with children. Much of this literature has attempted to explain changes in asset holdings in terms of changes in program eligibility rules over the past decade, exploiting variation over time and across states. The findings of the literature are somewhat mixed. While a full review of the literature is beyond the scope of this current report, we focus on two recent papers that give a flavor for the empirical analysis and its results.⁵

Sullivan (2006) focused on the impacts of asset rules in welfare programs, examining Aid to Families with Dependent Children (AFDC) and its successor, the TANF program, for selected years beginning in 1992. Using a sample of single mothers with low educational attainment, he found that differences in welfare program eligibility rules applicable to liquid assets did not appear to have substantially affected the asset holdings of the women in his analysis. However, he did find that variations in asset rules appear to have had substantial effects in increasing vehicle assets.

Whereas Sullivan focused principally on the effects of AFDC and TANF asset rules, McKernan et al. (2007) undertook a broader analysis of several low-income transfer programs, including welfare, the FSP, the Earned Income Tax Credit, and the minimum wage. Using a series of alternative multivariate regression specifications, they examined the impacts on asset holdings of the asset rules in these programs. Their results as applied to the FSP show no statistically significant effects of the program rules on liquid assets but do demonstrate positive effects on vehicle ownership and on the value of vehicle assets among low-education mothers and low-education families. Overall, the findings imply that, other things equal, FSP households tend to have higher average vehicle assets when they reside in a state with expanded categorical eligibility rules.

⁵ For an extensive review of the literature, see McKernan et al., 2007.

Based on the available literature, it appears likely that behavioral responses by households with children to changes in FSP asset rules would primarily affect vehicle assets, although behavioral responses to changes in FSP asset rules may be different for other types of households. If behavioral responses do primarily affect vehicle assets, our set of simulations that eliminate recent expansions in vehicle and categorical eligibility rules may overestimate the effect of these policy changes on eligibility levels. The MATH SIPP+ model estimated the number of households that would become ineligible for the FSP, taking their current measured assets as given. If we account for the possibility of a behavioral response, it is conceivable that some of the households that would lose eligibility under a reversion to federal FSP asset and categorical eligibility rules would instead adjust their vehicle holdings to retain eligibility. Thus, fewer households may lose eligibility than suggested by the microsimulation estimates.

The literature similarly suggests that behavioral responses to additional expansions in vehicle rules are possible. If all vehicles were excluded from the asset test, households currently living in states that count some vehicle assets against the asset limit might decide to acquire additional or more reliable vehicles. Indeed, many policymakers hope that limiting the amount of vehicle assets counted toward the asset limit will enable households that need reliable transportation to own dependable vehicles.

C. ELIGIBILITY RATES OF HOUSEHOLDS ELIGIBLE UNDER SIMULATED CHANGES TO ASSET AND CATEGORICAL ELIGIBILITY POLICIES

Another way to examine the varying effects of simulated policy changes is to compare the estimated percentages of households with income below 200 percent of poverty that would be

eligible in the baseline and under the various policy simulations. Tables III.9, III.10, and III.11 present these “eligibility rates” constructed for selected economic and demographic subgroups.⁶

1. Eligibility Rates in 2006

We estimate that 55 percent of all U.S. households with income below 200 percent of poverty were eligible for the FSP in 2006 (Table III.9). Households in poverty were much more likely to be eligible for the FSP (86 percent) than were households with income between 131 and 200 percent of poverty (12 percent), although it is interesting to note that 14 percent of households in poverty were not eligible for the FSP. Most households with income from TANF were eligible for the FSP, but less than half of low-income households with earnings met the FSP eligibility requirements. Low-income households with assets were also less likely on average to qualify for the FSP—households with financial assets, vehicle assets, and home equity had eligibility rates of 41, 45, and 37 percent, respectively.

Slightly fewer than half of low-income households with elderly members were eligible as compared to slightly more than half of low-income households with children. Seventy-four percent of low-income households reporting very low food security passed the FSP eligibility tests, leaving 26 percent of this needy group ineligible for the FSP.

2. Eligibility Rates under Simulated Policy Changes

Under the simulated policy changes, the overall eligibility rate varies from 50 percent under the simulation to revert to federal FSP asset rules and eliminate expanded categorical eligibility (Table III.9, last column, top cell) to 66 percent under the simulation to eliminate the asset test (Table III.10, last column, top cell). Policies that would exclude additional vehicles from the

⁶ These tables do not include households comprised solely of individuals who are categorically ineligible for the FSP in all states, such as certain noncitizens and nondisabled nonelderly childless adults.

asset test or revert to federal FSP asset rules without changing state categorical eligibility rules would have little or no effect on the percentage of households eligible for the FSP.

Source: 2006 Baseline of 2002 MATH SIPP+ model, September 2007 update

While most of the simulated policy changes affect the eligibility of households across the income distribution, many of the policy changes affect households at one poverty level more than at another. For instance, elimination of expanded categorical eligibility lowers the eligibility rate of households under 100 percent of poverty by 2 percentage points to 84 percent

but lowers the eligibility rate of households with income between 101 and 130 percent of poverty by 4 percentage points to 69 percent and the eligibility rate of households between 131 and 200 percent of poverty by 6 percentage points to 6 percent. On the other hand, the simulation to exclude retirement assets from countable assets has a negligible effect on the eligibility rate of households at the higher income level while raising the eligibility rates of the two lower-income groups by slightly more than 1 percentage point (Table III.11). At the other extreme, elimination of the asset test increases the eligibility rate of households in poverty by 14 percentage points to 100 percent, ensuring that all households in poverty (except those consisting entirely of categorically ineligible individuals) are eligible for the FSP. However, elimination of the asset test has an even larger effect on households with income just above the poverty level, raising that eligibility rate by 19 percentage points to 91 percent. Similarly, the simulations to increase asset limits have the largest effect on the eligibility of households with income just above the poverty level.

The eligibility rates of households receiving public assistance change little if at all under the simulated policy changes while the eligibility rates for working households fluctuate by 12 percentage points under the various policies. Regardless of the policies simulated, about 95 percent of households with TANF income are eligible for the FSP. Similarly, the eligibility rate of households with SSI income varies only slightly from 87 percent to 89 percent. The simulation to eliminate the asset test has the largest, although still small, positive effect on SSI households, and the simulations to eliminate expanded categorical eligibility have comparable negative effects. Eligibility rates of households with earnings, on the other hand, increase by 7 percentage points to 53 percent under the simulation to eliminate the asset test and decrease by 5 percentage points to 41 percent under the simulation to eliminate categorical eligibility and revert to federal FSP asset rules.

All of the simulated policy changes have a slightly larger effect on the eligibility of households with assets than on the eligibility of all households. The simulations to increase asset limits raise the eligibility rates of households with financial assets more than the eligibility rates of households with vehicle assets or home equity. On the other hand, eliminating the asset test, eliminating categorical eligibility, or excluding retirement assets from countable assets would each have the largest effect on the eligibility rate of households with home equity.

Although the eligibility rate of households with elderly members is lower than the overall eligibility rate, it increases more than the overall eligibility rate under most of the policy changes simulated. Elimination of the asset test would increase the elderly eligibility rate by 19 percentage points to 66 percent, which is the same eligibility rate as for all households under that simulation. The simulation to eliminate state expansions in asset and categorical eligibility lowers the elderly eligibility rate by 5 percentage points, as compared to the 4 percentage point decrease in the overall eligibility rate, to just 43 percent.

Most of the simulated policy changes would have little or no effect on the eligibility rates of households reporting low or very low food security. The exceptions are the simulations to eliminate categorical eligibility, which would lower those eligibility rates by around 2 percentage points, and the simulation to eliminate the asset test, which would raise the eligibility rates by 4 and 3 percentage points, respectively.

D. VARIATIONS IN FOOD STAMP PROGRAM ELIGIBILITY ACROSS STATES UNDER SIMULATED CHANGES TO FEDERAL AND STATE ASSET POLICIES

Our analysis also assessed variations in FSP eligibility across states. As noted, state-specific changes in how the FSP treats assets and categorical eligibility suggest that some households could be eligible for the FSP in one state but not in another, raising issues about equity across states in eligibility for benefits. Such variable eligibility is a potential policy concern because the

FSP has traditionally been viewed as a *national* program, providing consistent “safety net” protection across the country. Therefore, it is important to determine the degree of variation in eligibility across states and to examine the characteristics of affected households.

Although most households eligible for the FSP would be eligible regardless of the state in which they reside, FSP eligibility does vary across states for some households. In the baseline, or under 2006 FSP rules, 68 percent of eligible household are eligible under all state rules (Table III.12). In other words, 68 percent of eligible households would be eligible regardless of the state in which they reside while 32 percent would be eligible in at least one state and ineligible in at least one state. A majority of households that would be eligible in some but not all states, or 21 percent of all eligible households, would be eligible in 47 to 50 states.⁷ Ten percent of all eligible households would be eligible in 6 to 46 states and only 1 percent would be eligible in just 1 to 5 states.

1. Sources of Eligibility Variations across States

The largest source of variation across states is the categorical ineligibility of SSI recipients in California. As noted in the Methodology section, SSI recipients in California receive additional SSI benefits that are intended to substitute for FSP benefits. In our baseline simulation of 2006 FSP rules, we treat SSI recipients in California as ineligible for the FSP because (1) the benefits they receive are not formally FSP benefits and (2) California SSI recipients would not be affected by the policy changes simulated in this project. Because this policy is unique to California, all households that consist purely of SSI recipients are eligible for the FSP in all states except for California. Thus the number and characteristics of households eligible in some but not all states reflect, in part, the large proportion of these households that

⁷ For the purposes of this analysis, we treat the District of Columbia as a state, so a household can be eligible in a total of 51 “states”.

receive SSI income. If California SSI recipients were eligible for the FSP, the estimated number of FSP-eligible households would be slightly higher, and the percentage of FSP-eligible households that would be eligible in all states would rise from 68 percent to 85 percent (Table III.12). Furthermore, the percentage of households eligible in exactly 50 states would drop from 20 percent to 2 percent. However, the percentages of households eligible in 6 to 46 states and in 1 to 5 states remain approximately the same—9 and 1 percent respectively. Appendix C presents a further discussion of this issue along with additional tables showing the effect of California’s SSI cash-out policy on FSP eligibility.

Another source of eligibility variation across states is states’ flexibility to expand their asset and categorical eligibility policies. As discussed in the Methodology section, individual states have set policies that range from making virtually all low-income households categorically eligible to retaining the more restrictive federal FSP asset rules. These policies affect the number of states in which households are FSP-eligible. For instance, 11 states have expanded their categorical eligibility policies to either all low-income households or low-income households with certain characteristics such as households with children (Table II.1). We see the effect of these policy variations in the first column of numbers in Table III.12, where the number of households eligible for the FSP in exactly 11 states, for instance, is much higher than the number eligible in exactly 12 states.

State policies also vary in other ways that affect FSP eligibility. First, some states provide a state supplement to federal SSI benefits, with variation in the size of the supplement. In states with a particularly high SSI supplement, households that include an SSI recipient but that are not pure PA households are less likely to be income-eligible for the FSP than households in states with no or a lower supplement. Another policy difference is the treatment of unemployed nonelderly nondisabled childless adults. These individuals are subject to time limits on benefit receipt unless they live in a waiver area, qualify for a state-determined exemption, or participate

in an employment or training program. In some states, most unemployed nonelderly nondisabled childless adults are eligible; in others, a smaller percentage is eligible. These and other policy variations affect a relatively small number of households.

Note: The District of Columbia is included in this table, so a household could be eligible in a total of 51 “states”.

2. Variations in Characteristics of Households Eligible in 2006

We have seen that substantial numbers of households (32 percent) are eligible for the FSP in some states but not in others, thus raising possible equity concerns. Therefore, it is prudent to

examine the characteristics of these households in order to assess which types of households are most affected by state policy variations.

In 2006, the likelihood that household gross income fell below the poverty line varied substantially by the number of states in which a household was eligible. Seventy-one percent of households eligible in all states were in poverty while only 1 percent of households eligible in just a few states were in poverty (Table III.13).⁸ Similarly, 7 percent of households eligible in all states received income from SSI as compared to 40 percent of households eligible in some but not all states.⁹ Most TANF recipients were eligible in all states, although 2 percent of households eligible in some but not all states received cash TANF benefits. The fewer the states in which a household was eligible, the more likely it was that the household had financial or vehicle assets or owned a home. Among households eligible in just a few states, 90 percent had financial assets, 75 percent had vehicle assets, and 61 percent owned a home in contrast to 49, 48, and 23 percent, respectively, of households eligible in all states.

Sixty percent of households eligible in just a few states included elderly adults but only 6 percent included children. On the other hand, only 21 percent of households eligible in all states included elderly adults, but 51 percent included children.

The prevalence of food insecurity increased with the number of states in which a household was eligible. Almost 20 percent of households eligible in most or all states reported low or very low food security as compared to 6 percent of households eligible in just a few states.

⁸ An even higher percentage of households eligible in almost all states were in poverty—81 percent—because of the high number of households receiving SSI that are eligible in some but not all states. Under a simulation to eliminate the SSI cash-out policy in California, that percentage drops to 54 percent (Appendix C, Table C.6). Under either scenario, over 90 percent of households eligible in just a few states had income over 130 percent of poverty.

⁹ Under a simulation to eliminate SSI cash-out in California, those percentages become 21 and 11 percent, respectively (Appendix C, Table C.5).

3. Effects of Policy Changes on Variations in Eligibility

As part of our research, we examined the effect of changes to asset and categorical eligibility policies on variations in eligibility among states. We found that all of the policy changes we simulated increased the percentage of eligible households that were eligible in all states. The most expansive simulation, that is, elimination of the asset test, resulted in the largest

percentage—76 percent—of eligible households that would be eligible in all states (Table III.14). The second-highest percentage of households eligible in all states—74 percent—came under the most restrictive simulation, which is the reversion to federal FSP asset rules and elimination of expanded categorical eligibility. While both simulations reduced variations in eligibility across states, the number of households that would be eligible in all states is much higher under the expansive policy option—19.0 million versus 13.8 million under the most restrictive policy option.

TABLE III.14

HOUSEHOLDS ELIGIBLE UNDER SIMULATED CHANGES TO ASSET AND CATEGORICAL ELIGIBILITY RULES BY NUMBER OF STATES IN WHICH HOUSEHOLD WAS ELIGIBLE

	Eligible Households				
	Total (000s)	Eligible under All State Rules		Eligible under Some But Not All State Rules

Source: 2006 Baseline of 2002 MATH SIPP+ model, September 2007 update

Comparing two simulations that would standardize the treatment of vehicle assets among non-categorically eligible households across states, we see that both the simulation to exclude all

vehicles from the asset test (the expansive policy change) and the simulation to revert to federal FSP asset rules increase the percentage of households eligible in all states, to 70 and 68 percent, respectively. However, the expansive policy change also leads to a larger number of households eligible in all states (14.3 million). The restrictive policy option, on the other hand, leaves unchanged the number of households eligible in all states; households that became newly ineligible under the simulation were already ineligible in the one state that still used federal FSP asset rules in 2006.

The simulation that excluded assets in retirement accounts from countable assets had the smallest effect on the percentage of eligible households eligible in all states. While this policy change increased both the number of households eligible in all states and the number eligible in some but not all states, the former number increased slightly more, resulting in an increase of half a percentage point in the percentage eligible in all states.

E. CHARACTERISTICS OF HOUSEHOLDS PARTICIPATING IN THE FOOD STAMP PROGRAM IN 2006 AND UNDER SIMULATED CHANGES TO CATEGORICAL ELIGIBILITY POLICIES

While the MATH SIPP+ model predicts FSP participation in the baseline and under simulated changes, the QC Minimodel is the preferred model for estimating the effects on participation of restrictive policy changes. It is particularly well suited to simulating changes to categorical eligibility rules because it contains data that can be used to identify all categorically eligible households and households that are categorically eligible through the receipt of non-cash benefits. In this section, we briefly describe the characteristics of participating households in FY 2006 (the baseline) and then discuss the effect on participation of two simulations that eliminate some of the recent expansions in categorical eligibility, including the characteristics of households that would remain eligible under these policy changes.

1. Characteristics of Households Participating in the Food Stamp Program in 2006

In 2006, an average 11.3 million eligible households participated monthly in the FSP (Table III.15).¹⁰ According to estimates from the QC Minimodel, 87 percent of participating households were in poverty while only 2 percent had income over 130 percent of poverty. The average gross income of participating households was \$782 per month, with an average monthly FSP benefit of \$208 (Table III.16).

TABLE III.15
CHARACTERISTICS OF HOUSEHOLDS PARTICIPATING IN FY 2006

	Participating Households	
	Number (000s)	Percent of Total
Total Households	11,315	100.0
Gross Income as a Percentage of Poverty Level		
At or Below 100	9,847	87.0
No income	1,581	14.0
1-50%	2,809	24.8
51-100%	5,457	48.2
Above 100%	1,434	12.7
101-130%	1,232	10.9
131-200%	223	2.0
Greater than 200%	14	0.1

¹⁰ Appendix P, in the *Technical Appendices* to the main report, and the report by Wolkwitz (2007a) provide detailed information on the characteristics of participating households.

TABLE III.16

AVERAGE MONTHLY BENEFIT AND INCOME OF HOUSEHOLDS PARTICIPATING IN FY 2006

	Average Values (\$)
Monthly Benefit	208
Monthly Gross Income Among Households with Positive Income	782
Monthly Net Income Among Households with Positive Net Income	478
Monthly Income From Income Type Among Households with Income Type	
Earnings	894
Temporary Assistance for Needy Families	391
Supplemental Security Income	470
Social Security	626

Source: FY 2006 QC Minimodel

More participating households received income from earnings than from any other single income source: 30 percent included a worker with earned income as compared to 13 percent with a TANF recipient, 27 percent with an SSI recipient, and 24 percent with a Social Security recipient. The average monthly income from these sources (among households with the income type) was \$894 from earnings, \$391 from TANF, \$470 from SSI, and \$626 from Social Security.

Over half of participating households included children (52 percent) while less than a fifth included an elderly member (18 percent). Disabled nonelderly adults were present in 23 percent of participating households.

2. Participation under Simulations to Eliminate State Expansions in Categorical Eligibility

We simulated two categorical eligibility policy changes in the QC Minimodel. In the first simulation, we eliminated categorical eligibility for all households that were not pure PA such that non-pure PA households that did not pass the federal income tests became ineligible. In the second simulation, households that received any cash PA retained their categorical eligibility, but households that were categorically eligible through the receipt of non-cash benefits had to pass the federal FSP income tests to remain eligible. In both these simulations, we did not subject

households losing categorical eligibility to the FSP asset test because of limited information in the administrative data on asset holdings for categorically eligible households.

We found that 1 percent of FY 2006 participants would fail the income tests and lose FSP eligibility if categorical eligibility were eliminated for non-pure PA households (Table III.17).¹¹ The simulation to eliminate categorical eligibility only for non-pure PA households receiving only non-cash benefits has a similar, although slightly smaller, effect on participation. Because households that would fail the income tests have slightly higher income than the average participating household, their monthly benefits tend on average to be lower. As a result, total monthly benefits paid out would drop only slightly under either policy change.

TABLE III.17

PARTICIPATING HOUSEHOLDS AND BENEFITS RECEIVED UNDER SIMULATIONS TO ELIMINATE STATE EXPANSIONS IN CATEGORICAL ELIGIBILITY

	Participating Households			Benefits

- *** Change is statistically different from zero at a 99% level of significance

¹¹ Appendices Q and R, in the *Technical Appendices* to the main report, present detailed tables with the results of the two simulations.

Under both simulations, the number of participating households in poverty does not change, but the number with income over 131 percent of poverty drops by over 40 percent (Table III.18). Households with earnings are disproportionately affected, with their number dropping by 3 percent. Households with TANF or SSI are minimally affected by the first simulation, however, and not affected at all by the second. Under both policy changes, the number of households with children would drop by a slightly higher percentage than would the number of all households and the number with elderly by a slightly lower percentage.

APPENDIX A

MICROSIMULATION MODELS

This appendix provides additional details about the two microsimulation models used in the research. We first discuss the MATH SIPP+ model, explaining major aspects of the model development process, describing how the version of the model used in this research differs from previous versions, and summarizing the federal and state asset rules simulated in the model. We then briefly describe important aspects of the QC Minimodel.

A. MATH SIPP+ MODEL

The MATH SIPP+ model was developed under a contract with FNS to provide that agency with estimates of the effects of proposed policy changes on the FSP. We first developed the 2002 MATH SIPP+ model, which simulates the FSP program in September 2002. Smith (2006) describes the creation of that model. Next, we created the 2006 Baseline of the 2002 MATH SIPP+ model to simulate the FSP in FY 2006. Trippe et al. document the 2006 Baseline (2006). Finally, for the present project, we updated the 2006 Baseline to simulate state asset rules as of January 2007, to take advantage of more recent administrative data, to add data on food security and home equity, and to incorporate some minor programming improvements. Below, we describe the data that the model operates on, major details of the model, how the current version differs from the previous version, and the asset rules simulated in the current version.

1. Data Sources

We used three data sources to develop the 2006 Baseline of the 2002 MATH SIPP+ model:

- a. Selected data files of the 2001 SIPP Panel, including the Wave 6 Core file, Wave 2 Topical Module file, and Wave 6 Topical Module file
- b. The March 2002 and 2003 CPS ASEC
- c. Administrative data for the FSP and the SSI and TANF programs, namely, the FY 2005 FSPQC datafile, 2002 SSI Recipients by State and County, and FY 2001 ACT “emergency” TANF file

The SIPP, a nationally representative longitudinal survey, contains monthly information on household composition and income and periodic information on asset holdings, household expenses, and citizenship status. The 2002 MATH SIPP+ model is based on households in the SIPP in September 2002 as found on Wave 6 of the 2001 SIPP Panel. The model database incorporates the Wave 6 Topical Module file on these households' financial and vehicle assets and medical care, dependent care, shelter, and child support payment expenses. Data on the citizenship status of these households, from the Wave 2 Topical Module file, and data on food security, from the Wave 8 Topical Module file, are also merged into the model database. In September 2002, 26,498 households and 69,049 individuals were successfully interviewed for Wave 6 of the 2001 SIPP Panel.

The CPS is a monthly survey of approximately 80,000 households and is representative at the state level. It asks a set of basic questions on household composition, demographics, and labor force participation. The Annual Social and Economic Supplement (ASEC), conducted in March, collects additional information on household income and participation in various government programs. We used data from the March 2002 and 2003 CPS ASEC to adjust household weights in the SIPP so that the 2002 MATH SIPP+ model would match state distributions.

The FSPQC datafile is an edited version of the raw data file generated by the FSP's Quality Control System that contains detailed demographic and economic data on FSP participants. We used data from the FY 2005 FSPQC datafile so that the number and characteristics of FSP participants in the MATH SIPP+ model would match national and state administrative totals. The SSI administrative data provide the number of SSI recipients by age and state, and the TANF administrative data provide detailed demographic and economic information for a

nationally representative sample of TANF units. We used the latter two data sets to create targets for SSI and TANF participants in the MATH SIPP+ model.

2. Model Details

Selected aspects of the MATH SIPP+ model development are described below.

State Weights. We developed state weights for the MATH SIPP+ model by using a Poisson regression algorithm developed and evaluated by Schirm and Zaslavski (2001) and a set of 33 state population control totals derived from the CPS. Under this method, each household is given a set of 51 weights; each weight estimates the number of households that the sample household represents in a particular state, and the sum of the weights equals the household's original SIPP weight. In addition, the weighted sums of the values for the state control variables equal the state control totals.

To help illustrate the development and use of the set of 51 state weights, it is useful to consider a sample household. The sample household resides in Idaho and has an original SIPP household weight of 4,127, meaning that, in the SIPP, the household represents 4,127 actual Idaho households. During the MATH SIPP+ model re-weighting process, the household was assigned to represent 52 Idaho households along with 8 Alaska households, 3 Alabama households, 29 Arkansas households, and so on through less than 1 West Virginia household and less than 1 Wyoming household. Even though the sample household resides in Idaho, it actually has larger state weights for several other states, including California (1,068) and Florida (511). At the other end of the spectrum, it represents 0 households in Washington, DC.

If the sample household were eligible in all states, it would contribute 4,127 households to the number of eligible households in the country. However, the household is eligible in only the 11 states with expanded categorical eligibility policies and therefore can contribute only 487 households (the sum of the state weights for the states in which the household is eligible) to the

national total of eligible households. Given that Idaho uses the relatively more restrictive federal FSP asset and categorical eligibility rules, the sample household is ineligible in the state in which it resides.

Standard Errors. In order to test the statistical significance of effects of policy changes estimated in the MATH SIPP+ model, we developed a methodology to calculate standard errors. As recommended by the Census Bureau, we used Fay's method, a modified form of the basic balanced repeated replication method.¹ Calculating variances with this method requires the use of a set of 108 household replicate weights that can be obtained from the Census Bureau upon request. We applied the reweighting procedure used to create the set of 51 state weights described above to each of the 108 replicate weights. Variance estimates are computed by state using the set of 108 state replicate weights and then summed to create a national variance estimate for each model estimate.

We also use the standard errors created with this methodology to calculate the sampling error associated with point estimates generated by the MATH SIPP+ model. Table A.1 shows the 90-percent confidence intervals of selected estimates. We estimate that 20,493,000 households were eligible for the FSP in 2006, plus or minus 451,000 households. In other words, there is a ninety percent chance that the true number of eligible households is between 20,042,000 and 20,944,000 households.²

¹ The online document at <http://www.bls.census.gov/sipp/3rddrft2.pdf> includes a brief explanation of Fay's method.

² More information on the accuracy of SIPP-based estimates as well as a discussion of confidence intervals can be found in the Source and Accuracy Statement for the SIPP 2001 Panel Wave 1 - Wave 9 Public Use Files, available online at http://www.census.gov/sipp/sourceac/S&A-2_SIPP2001_w1tow9_20050214.pdf.

TABLE A.1

Source: 2006 Baseline of 2002 MATH SIPP+ model, September 2007 update

Simulated TANF/SSI Participation. As with most national surveys, the SIPP underreports participation in public assistance programs. The SIPP underreports the number of TANF participants by nearly 40 percent and the number of SSI recipients by nearly 3 percent. The MATH SIPP+ model simulates both TANF and SSI participation to improve the model results.

To simulate SSI participation, we first assign elderly and disabled people to an SSI unit, then we determine whether the SSI units pass the SSI income and asset eligibility tests, and, finally, we choose participants from among eligible units in such a way that the simulated SSI caseload matches SSI administrative data. The SSI calibration was not updated for the 2006 Baseline, so the simulated SSI population is based on the 2002 SSI Recipients by State and County file used for the 2002 MATH SIPP+ model development. SSI participants are assigned an SSI benefit based on their income, the federal benefit amount, and the state supplement, if applicable.

We follow a similar procedure to simulate TANF receipt. We first form TANF units consisting of dependent children and their guardians or of a pregnant woman. We then determine whether each unit is eligible by applying the appropriate state asset and income tests. Unlike the case of the SSI simulation, which calculates a benefit amount, the TANF simulation predicts a TANF benefit by using equations derived from administrative data. Finally, an algorithm is used to select TANF participants from among the pool of eligible households to match TANF administrative data. As with the SSI simulation, the TANF calibration was not updated for the 2006 Baseline, so the simulated TANF population is based on the FY 2001 ACT “emergency” TANF file used for the 2002 MATH SIPP+ model development.

Simulated FSP Participation. As with TANF and SSI receipt, FSP receipt is underreported in both the SIPP and the CPS. FSP administrative data show that 19.7 million people received food stamp benefits in September 2002 while the SIPP shows 17.7 million FSP participants, a difference of 10 percent as a consequence of underreporting (Smith 2005). To overcome this

problem, we simulate FSP receipt. As with the SSI and TANF simulations, the FSP simulation begins by forming FSP units (described immediately below). Once a unit is formed, the simulation determines whether that unit would be eligible for the FSP under the income and asset rules in place in each state. In other words, the model makes 51 separate eligibility determinations. Section 4 below summarizes the state rules used to determine asset and categorical eligibility. The benefit amount for eligible households is determined according to FSP rules. First, net income is determined by subtracting certain deductions from gross income; next, the benefit is calculated by subtracting 30 percent of net income from the maximum benefit for that household's size. The final step in the simulation is to select participating households from among eligible households so that the characteristics of the participating population closely match administrative data. While households that reported FSP receipt in the SIPP were more likely than nonreporting households to be selected as FSP participants in the MATH SIPP model, the precursor to the MATH SIPP+ model, we obtained better results in the MATH SIPP+ model by not favoring those households when selecting the simulated FSP population.

Unit Formation. Decisions about which household members to include in the “FSP unit,” the group of people who apply for the FSP together, can affect simulated FSP participation. Given that asset limits do not vary with FSP unit size, larger FSP units are more likely to have combined assets over the asset limit than are smaller FSP units. In addition, including or excluding from the FSP unit an individual with relatively high income can influence whether that FSP unit is income-eligible. Most FSP units include all members of the household, but, in some households, some members purchase and prepare food separately and therefore are allowed to form their own FSP unit. In the MATH SIPP+ model, FSP units are formed one of three ways. In households reporting FSP participation, we use the reported information to form FSP units. In households that do not report FSP receipt, the family and subfamily units become the FSP units.

However, we combine some of these FSP units when an individual or the head of a subfamily reports sharing food expenses with another family in the household. We also follow FSP rules that require children under age 22 to apply with their parents.

Several groups of people are categorically ineligible for the FSP and are excluded from our simulated FSP units. These groups include certain noncitizens and nondisabled nonelderly childless adults as well as California SSI recipients, some post-secondary students, and some people living in group quarters. Noncitizens who are refugees, are under age 18, are receiving disability benefits, or have been in the country for five years are eligible for the FSP. We remove other noncitizens from their FSP unit but prorate some of their income and expenses back to the unit. With refugees not identifiable in the SIPP data, we randomly assign refugee status to some noncitizens based on administrative data from the U.S. Department of Homeland Security. The data for identifying other eligible non-citizens are available in the SIPP. We are also unable to determine which unemployed nondisabled childless individuals age 18 to 49-years are eligible for the FSP because they are in their first three months of receipt, live in a waiver area, or qualify for a state exemption. Therefore, we randomly select individuals in this population to be eligible based on state data.

3. Changes from Standard 2006 Baseline

We conducted the research presented in this report with an updated version of the 2006 Baseline of the 2002 MATH SIPP+ model. Finalized in September 2007, the update uses recent administrative data and information on state asset and categorical eligibility policies, includes additional SIPP data, and implements some minor code improvements.

The previous version of the 2006 Baseline used FY 2005 FSP program operations data and the FY 2004 FSPQC datafile, which were the most recent data available at the time, to calibrate the simulated participant population. For the September 2007 update, we recalibrated the model

by using FY 2006 program operations data and FY 2005 FSPQC datafile. In addition, we updated the simulation of state asset and categorical eligibility rules to reflect the rules in place in January 2007. The next section describes the rules, with changes from the previous model version noted.

While developing the September 2007 version of the 2006 Baseline, we also merged additional data from the SIPP topical modules. Specifically, we added data on households' reported food security status and home equity.

Finally, the current version of the MATH SIPP+ model incorporates some minor code improvements developed while conducting simulations for FNS in the previous version. This version, for instance, properly excludes assets in 401K plans from countable assets.

4. Asset and Categorical Eligibility Rules Simulated in the MATH SIPP+ Model

The federal vehicle rules and state asset rules simulated in the updated 2006 Baseline of the MATH SIPP+ model are summarized below and displayed in Table A.2. It is important to note that a household may not be categorically eligible if it includes a member disqualified from participation in the FSP for an intentional program violation or failure to comply with work regulations.

The **federal** vehicle rules exclude vehicles with equity under \$1,500 and a limited number of other vehicles based on their use. Of the remaining vehicles, one vehicle for each adult and one vehicle for each teenager who is either in school or working is assessed at the vehicle's fair market value (FMV) minus \$4,650. If there are no adults or qualifying teenagers in the FSP household, one vehicle is assessed in this manner. Any additional vehicles are assessed at the higher of the vehicle's FMV minus \$4,650 or the vehicle's equity (FMV minus liens)

Alabama excludes all vehicles.

TABLE A.2

JANUARY 2007 STATE ASSET AND CATEGORICAL ELIGIBILITY RULES SIMULATED IN THE MATH SIPP+ MODEL

	Categorically Eligible Households (in Addition to Pure PA Households)	Asset Rules for Non-Categorically Eligible Households		Other Asset Eligibility Rules
		Use Federal Rules	Exclude All Vehicles	
Alabama			yes	
Alaska				Exclude one vehicle per driver
Arizona			yes	
Arkansas				Exclude one vehicle
California			yes	
Colorado			yes	
Connecticut				For highest equity vehicle, count equity minus \$9,500
Delaware	Households below 200% of poverty		yes	No asset test
DC			yes	
Florida				For households without individuals subject to work requirements, \$8,500 in equity is excluded from one vehicle. For other households, \$8,500 in equity is excluded from the combined equity of one vehicle per nondisabled nonelderly adult.
Georgia			yes	
Hawaii			yes	
Idaho		yes		
Illinois				Exclude one vehicle
Indiana			yes	
Iowa				Exclude one vehicle
Kansas			yes	
Kentucky			yes	
Louisiana			yes	
Maine	Households below 200% of poverty and with a child and caretaker			Exclude one vehicle
Maryland	Households below 200% of poverty and with a child		yes	
Massachusetts	Households below 200% of poverty and with a child		yes	
Michigan	Households below 200% of poverty and more than one person		yes	\$3,000 asset limit for all households
Minnesota	Households passing FSP income tests and with non-vehicle assets under \$7,000			For all vehicles, count FMV minus \$7,500
Mississippi			yes	
Missouri			yes	

TABLE A.2 (continued)

		Asset Rules for Non-Categorically Eligible Households		
Categorically Eligible Households (in Addition to Pure PA Households)		Use Federal Rules	Exclude All Vehicles	Other Asset Eligibility Rules
Montana			yes	
Nebraska				For vehicle with highest FMV, count FMV minus \$12,000
Nevada				Exclude one vehicle
New Hampshire				Exclude one vehicle per adult
New Jersey				For vehicle with highest FMV, count FMV minus \$9,500
New Mexico			yes	
New York				Exclude one vehicle per driver
North Carolina				Exclude one vehicle per adult
North Dakota	Households below 200% of poverty			Exclude one vehicle; Asset limit of \$3,000 for 1 person, \$6,000 for 2, +\$25 for each additional person
Ohio			yes	
Oklahoma				Exclude one vehicle per driver, then count equity minus \$5,000 for remaining vehicles
Oregon	Households below 185% of poverty			For highest equity vehicle, count equity minus \$10,000; Asset limit of \$2,500 for nonelderly nondisabled households
Pennsylvania				Exclude one vehicle
Rhode Island				Exclude one vehicle per adult, up to two adults
South Carolina	Households below 200% of poverty			Exclude one vehicle per driver, Asset limit of \$2,500 for nonelderly nondisabled households
South Dakota				Exclude one vehicle
Tennessee			yes	
Texas	Households below 165% of poverty with assets under \$5,000 after excluding \$15,000 from first vehicle	yes		
Utah			yes	
Vermont				Exclude one vehicle per adult, up to two adults
Virginia			yes	
Washington	Households below 130% of poverty			For highest equity vehicle, count exclude 5,000 equity
West Virginia			yes	
Wisconsin	Households below 200% of poverty		yes	
Wyoming				If household is headed by a married couple, exclude \$12,000 from the combined FMV of two vehicles. Otherwise, exclude \$12,000 from the FMV vehicle with highest FMV.

Alaska excludes one vehicle per adult and one per teenager who is either in school or working. Remaining vehicles are subject to the federal food stamp rules.

Arizona excludes all vehicles.

Arkansas excludes one vehicle. Remaining vehicles are subject to the federal FSP rules.

California excludes all vehicles.

Colorado excludes all vehicles.

Connecticut excludes \$9,500 in equity for vehicle with highest equity. Remaining vehicles are subject to the federal FSP rules.

Delaware extends categorical eligibility to all households with gross income below 200 percent of poverty. Households not categorically eligible are still not subject to an asset test. (This is a change from the previous version of the MATH SIPP+ model.)

The **District of Columbia** excludes all vehicles.

Florida distinguishes between households without workers or individuals subject to work requirements and households with workers or individuals subject to work requirements. For households without workers or individuals subject to work requirements, \$8,500 in equity is excluded from vehicle with highest equity. For households with workers or individuals subject to work requirements, \$8,500 in equity is excluded from the combined equity of one vehicle per nondisabled nonelderly adult. In both cases, remaining vehicles are subject to the federal FSP rules.

Georgia excludes all vehicles.

Hawaii excludes all vehicles.

Idaho is the only state that still follows the federal FSP rules.

Illinois excludes one vehicle. Remaining vehicles are subject to the federal FSP rules. (This is a change from the previous version of the MATH SIPP+ model.)

Indiana excludes all vehicles.

Iowa excludes one vehicle. Remaining vehicles are subject to the federal FSP rules.

Kansas excludes all vehicles.

Kentucky excludes all vehicles.

Louisiana excludes all vehicles.

Maine extends categorical eligibility to all households with gross income below 200 percent of poverty and with a child and a caretaker. For households not categorically eligible, one vehicle is excluded, and remaining vehicles are subject to the federal FSP rules.

Maryland extends categorical eligibility to all households with gross income below 200 percent of poverty and with a child. For households not categorically eligible, all vehicles are excluded.

Massachusetts extends categorical eligibility to all households with gross income below 200 percent of poverty and with a child. For households not categorically eligible, all vehicles are excluded.

Michigan extends categorical eligibility to all households with gross income below 200 percent of poverty and with more than one person. For households not categorically eligible, all vehicles are excluded, and the asset limit for households without an elderly or disabled person is \$3,000.

Minnesota extends categorical eligibility to households that pass the FSP income tests and have no more than \$7,000 in non-vehicle assets. For households not categorically eligible, vehicles are counted at their FMV minus \$7,500. (This is a change from the previous version of the MATH SIPP+ model.)

Mississippi excludes all vehicles.

Missouri excludes all vehicles.

Montana excludes all vehicles.

Nebraska excludes \$12,000 from the FMV of vehicle with highest FMV. Remaining vehicles are subject to the federal FSP rules.

Nevada excludes one vehicle. Remaining vehicles are subject to the federal FSP rules.

New Hampshire excludes one vehicle per adult. Remaining vehicles are subject to the federal FSP rules.

New Jersey excludes \$9,500 from the FMV of vehicle with highest FMV. Remaining vehicles are subject to the federal FSP rules.

New Mexico excludes all vehicles.

New York excludes one vehicle per adult and one per teenager who is either in school or working. Remaining vehicles are subject to the federal FSP rules. (This is a change from the previous version of the MATH SIPP+ model).

North Carolina excludes one vehicle per adult. Remaining vehicles are subject to the federal food stamp rules.

North Dakota extends categorical eligibility to all households with gross income below 200 percent of poverty. For households not categorically eligible, one vehicle is excluded, and remaining vehicles are subject to the federal FSP rules. For these households, the asset limit is raised to \$3,000 for one-person households, \$6,000 for two-person households, and \$6,000 plus \$25 for each additional person over two for larger households.

Ohio excludes all vehicles.

Oklahoma excludes one vehicle per adult and one per teenager who is either in school or working and \$5,000 in equity from each remaining vehicle.

Oregon extends categorical eligibility to all households with gross income below 185 percent of poverty. For households not categorically eligible, \$10,000 in equity is excluded from vehicle with highest equity, and the asset limit for households without an elderly or disabled person is \$2,500.

Pennsylvania excludes one vehicle. Remaining vehicles are subject to the federal FSP rules.

Rhode Island excludes one vehicle per adult, up to two adults. Remaining vehicles are subject to the federal FSP rules.

South Carolina extends categorical eligibility to all households with gross income below 200 percent of poverty. For households not categorically eligible, one vehicle per adult and one per teenager who is either in school or working is excluded. Remaining vehicles are subject to the federal FSP rules. The asset limit for non-categorically eligible households without an elderly or disabled person is \$2,500.

South Dakota excludes one vehicle. Remaining vehicles are subject to the federal FSP rules.

Tennessee excludes all vehicles.

Texas extends categorical eligibility to households with gross income below 165 percent of poverty and assets below \$5,000 after excluding \$15,000 in FMV for one vehicle. Households not categorically eligible are subject to the federal FSP rules.

Utah excludes all vehicles. (This is a change from the previous version of the MATH SIPP+ model.)

Vermont excludes one vehicle per adult, up to two adults. Remaining vehicles are subject to the federal FSP rules.

Virginia excludes all vehicles.

Washington extends categorical eligibility to all households with gross income below 130 percent of poverty. For households not categorically eligible, \$5,000 in equity is excluded from vehicle with highest equity, and remaining vehicles are subject to the federal FSP rules.

West Virginia excludes all vehicles.

Wisconsin extends categorical eligibility to households with gross income below 200 percent of poverty. For households not categorically eligible, all vehicles are excluded.

Wyoming distinguishes between households made up of a married couple and those not made up of a married couple. For households made up of a married couple, \$12,000 is excluded from the combined FMV of two vehicles. For households not including a married couple, \$12,000 is excluded from one vehicle. Remaining vehicles are subject to the federal FSP rules.

B. QC MINIMODEL

The QC Minimodel is based on the FSPQC database, which is an edited version of the data file generated by the FSP's Quality Control System. For this project, we used the FY 2006 QC Minimodel, the development of which is documented by Wolkwitz and Ewell (2007). The QC Minimodel contains detailed demographic, economic, and FSP eligibility information for a sample of almost 46,000 households that participated in the FSP in FY 2006. The sample is representative at the state level and by month.

We edit the QC data to achieve consistency in each household's record. In particular, we ensure that certain basic relationships exist between the variables used to determine eligibility; we then compute a benefit amount. For example, in the edited file:

- Net income equals gross income minus the total deductions for which the household is eligible
- The FSP benefit equals the maximum benefit for that household size minus 30 percent of net income
- In editing the file, we incorporate state variations in program rules. The variations include:
- The benefit calculation for Minnesota Family Investment Program participants, which differs from the standard benefit calculation
- The eligibility determination and benefit calculations for SSI participants in the 8 states with Combined Application Projects

- Categorical eligibility rules in the 11 states that have expanded categorical eligibility to large segments of their low-income population

The QC data include only the income and asset information necessary to determine eligibility or to calculate the benefit amount. In most cases, all of the income received by a household is used to calculate the household's benefit if not to determine its eligibility. Frequently, however, some of a household's assets do not count toward the FSP asset limit. As a result, while the QC Minimodel contains useful income data, its asset data are limited and unreliable. For instance, in a state that excludes the value of all vehicles from the asset test, no information regarding a household's vehicle holdings needs to be collected. Thus, if a household's record shows no vehicle assets, we cannot tell whether the household has no vehicles or has vehicles that simply were not counted toward the asset test. Similarly, if a household is categorically eligible for the FSP, no information on any of the household's assets needs to be collected. Again, the available data do not allow us to determine whether a categorically eligible household has no assets or simply no countable assets. The lack of data on asset holdings makes it impossible to determine whether some households would pass the asset test if asset rules were changed to count additional assets toward asset limits.

We weight the FSPQC datafile and QC Minimodel to match administrative totals for households, individuals, and benefits by state and month. We adjust the initial administrative totals to remove households not eligible under regular FSP rules, namely, households that received benefits in error and households that qualified under the Disaster FSP.

APPENDIX B

**SUPPLEMENTAL ANALYSIS OF HOUSEHOLDS THAT BECOME NEWLY
ELIGIBLE UNDER A SIMULATION TO ELIMINATE THE FSP ASSET TEST**

The supplementary analysis described in this appendix was conducted to better understand the difference in results between a series of simulations that increased FSP asset limits in \$1,000 increments up to \$6,000 for most households and up to \$7,000 for households with an elderly or disabled member, and a simulation that eliminated the asset limits for all households (Table III.5). As reported in the body of this report, we found that while each incremental increase in the asset limit resulted in an increase in benefits to eligible households, the benefit increases became smaller as the asset limit became larger. In particular, benefits increased 1.7 percent when the asset limits were raised from \$2,000 for most households and \$3,000 for households with an elderly or disabled member to \$3,000 and \$4,000, respectively, but only 0.6 percent when the asset limits were raised from \$5,000/\$6,000 to \$6,000/\$7,000. Eliminating the asset test, however, resulted in a simulated 19.5 percent increase in benefits for which eligible households would qualify.

These results raised interesting questions about households that are income eligible for the FSP but have enough assets that they fail the asset test even when asset limits are doubled or tripled.³ For instance, do most of the households made eligible by the elimination of the asset test have asset holdings just slightly above the higher limits that were simulated, or do some have substantially higher levels of assets? What are the characteristics of these households with low incomes and relatively high assets? Are reported asset holdings consistent with reported income from assets? This appendix presents the additional analysis we conducted to answer these questions.

Table B.1 presents an overview of the number of income-eligible households by their type of asset holdings. The households fall into four mutually exclusive groups:

³ Income-eligible households are those that either pass or are not subject to the income tests.

1. **Households with gross and net income below the applicable income screens.** This group includes households that are not subject to the income tests but would pass them if they were. Households that would fail the income tests if subject to them fall into the three remaining groups below.
2. **Households with elderly or disabled members and gross income above the gross income screen.** These households are not subject to the gross income test.
3. **Pure public assistance households with gross and/or net income above the applicable income screen.** These categorically eligible households in which every member receives cash TANF, SSI, or GA benefits are not subject to either income test.
4. **Other categorically eligible households with gross and/or net income above the applicable income screen.** These households are eligible through state expansions in categorical eligibility and are not subject to either income test.

Table B.1 also presents data for two additional types of households. The first includes households that are both income and asset eligible. These households, whose characteristics are presented in Tables III.1 and III.2, are drawn from all four groups listed above. The second includes households with no income, a subset of the first group listed above.

These four mutually exclusive groups and two additional types of households are cross-tabulated by the presence and type of asset holdings. As shown in Table B.1, households are categorized by whether they have any assets, any countable assets, financial assets, countable financial assets, vehicle assets, and countable vehicle assets.⁴ Note that a small number of asset-eligible households have countable assets over \$3,000. These households are either in states with higher asset limits or in Delaware, which has used expansions in categorical eligibility to essentially eliminate the asset test for most households.

⁴ Countable assets are those that count toward the FSP asset limits. Assets that are not countable include assets owned by TANF and SSI recipients and by other households that are categorically eligible under state rules. In addition, non-countable vehicle assets include the value, or in some cases the partial value, of vehicles not counted under federal or state vehicle rules. Non-countable financial assets include rental assets, life insurance, and 401K accounts.

TABLE B.1

INCOME-ELIGIBLE HOUSEHOLDS BY TYPE OF ELIGIBILITY AND ASSET HOLDINGS

	Total Households (000s)	Numbers of Households With Assets (000s)						
		Any Assets			Financial Assets		Vehicle Assets	
		All ^a	All	\$3,000+	All	Countable	All	Countable
Income eligible ^a	24,941	18,542	8,711	3,968	14,503	8,687	13,428	206
Would pass both income tests	21,955	15,809	7,405	3,092	12,083	7,383	11,355	165
Elderly or disabled; would fail gross income test ^c	1,814	1,709	1,306	875	1,585	1,304	1,289	41
Categorically eligible, would fail income test(s)	1,171	1,024	0	0	835	0	784	0

Source: 2006 Baseline of 2002 MATH SIPP+ model, September 2007 update

^a Assets in this category include assets countable under state FSP rules and assets that do not count toward a household's asset limit such as vehicles disregarded under state rules, assets owned by categorically eligible households, some retirement accounts, and life insurance.

^b Income-eligible households are those that either pass or are not subject to the income tests.

^c Households containing an elderly or disabled member are not subject to the FSP gross income test.

Of the 24.9 million households that are income eligible for the FSP and therefore eligible under the simulation to eliminate the asset test, 18.5 million have reported assets. However, only 8.7 million have assets that count toward the limits. In other words, 6.4 million income-eligible households have no reported assets, and another 9.8 million have only assets that do not count toward the asset limits. The latter group comprises households that are either categorically eligible for the FSP and therefore not subject to the FSP asset test or that own assets that are disregarded by federal or state FSP rules, such as excluded vehicles, some retirement accounts, and life insurance.

Table B.2 presents the distribution of income-eligible households by their countable asset holdings; Table B.3 is an expanded version of Table B.2. Figure B.1 presents the same information graphically. The first graph shows households with countable asset holdings

between \$1 and \$900,000 in increments of \$50,000; the second shows households with countable asset holdings between \$1 and \$100,000 in increments of \$10,000; and the third shows households with countable asset holdings between \$1 and \$20,000 in increments of \$1,000. As shown in these tables and graphs, the countable assets of a majority of income-eligible households with such assets are low. However, over 5 percent have more than \$50,000 in countable assets (Table B.2). As shown in Table B.3, 17 percent of income-eligible households have between \$1 and \$2,000 in countable assets (the limit for most households), and an additional 2 percent have between \$2,001 and \$3,000 in countable assets (the limit for households with an elderly or disabled member). Together, these two groups account for over half of all income-eligible households with countable assets. As expected, the number of households at each level of countable assets slowly decreases as the asset levels increase.

TABLE B.2
DISTRIBUTION OF INCOME-ELIGIBLE HOUSEHOLDS BY ASSET HOLDINGS

	Number (000s)	Percent
Income-Eligible Households	24,941	100.0
Without Countable Assets	16,229	65.1

Source: 2006 Baseline of 2002 MATH SIPP+ model, September 2007 update

Note: The federal FSP asset limit for most households in 2006 was \$2,000. The federal asset limit for households with an elderly or disabled member was \$3,000. A few states implemented higher asset limits through expansions in categorical eligibility.

FIGURE B.1

DISTRIBUTION OF INCOME ELIGIBLE HOUSEHOLDS WITH COUNTABLE ASSETS

For the rest of our analysis, we focused on two types of households:

- Households that are income eligible for the FSP, are subject to and fail the asset test, and have at least \$7,000 in countable assets
- Households that are eligible for the FSP through state expansions in categorical eligibility and have at least \$7,000 in assets that would be counted if the households were subject to the asset test

For the first group, we restricted our analysis to households with at least \$7,000 in countable assets because they are made eligible not under the simulations to increase the asset limits, but under the simulation to eliminate the asset test. For the second group, we restricted our analysis to households with at least \$7,000 in assets that would count toward the asset limit for similar reasons; they would fail the asset test if they were subject to it even if the asset limits were raised by \$4,000. Some of the households in the latter group would also fail the income tests, while others would pass them.

Tables B.4 and B.5 present the characteristics of these two groups of households. In Table B.4, which shows income-eligible, asset-ineligible households with countable assets over \$7,000, 61 percent of the households have an elderly member (first set of columns) as do 67 percent of households with over \$100,000 in countable assets (last set of columns). Less than 20 percent have children in the household, and less than 50 percent are in poverty. A large majority of these households, 84 percent, have investment income, compared to only 28 percent with earned income. Very few households have countable vehicle assets (5 percent), while virtually all have countable financial assets, including 88 percent with interest-bearing assets and 43 percent with other income-producing financial assets.

Categorically eligible non-pure public assistance households with countable-type assets over \$7,000, shown in Table B.5, have somewhat similar characteristics to the households discussed above. Over 50 percent have an elderly member, while only 28 percent have children in the

household. Sixty percent are above the poverty level, 83 percent have investment income, and 36 percent have earned income. Slightly more have vehicle assets (15 percent), while virtually all have financial assets.

To assess whether reported income from assets appears to be consistent with reported asset holdings, we cross-tabulated households by the level of income-producing assets and by the amount of investment income (Tables B.6A and B.6B). In general, we found levels of income-producing assets to be relatively consistent with levels of investment income. For example, about two-thirds of the households in Table B.6A have between \$1 and \$100 in investment income. The majority of these households have under \$20,000 in income-producing assets. Furthermore, among households with over \$500 in investment income, most have over \$100,000 in income-producing assets. This seems reasonable: a 6 percent return on \$100,000 would result in a monthly income of \$500.

Through our additional analysis, we confirmed that most households that either pass or are not subject to the income tests have low levels of countable assets. We found, however, that a small minority of income-eligible households have substantial asset holdings. These households, which are eligible for the FSP under a simulation to eliminate the asset test but not under a simulation to increase the asset limits by \$4,000, tend to have elderly members, income above the poverty level, and income-producing assets.

TABLE B.4

INCOME-ELIGIBLE, ASSET-INELIGIBLE HOUSEHOLDS WITH COUNTABLE ASSETS OVER \$7,000

	Households by Countable Asset Levels																	
	\$10,001 -		\$20,000		\$30,000		\$40,000		\$50,000		\$60,000		\$70,000 +

Notes: Countable-type assets are assets that would count towards the FSP asset limit if the household was subject to the asset test.

This table contains both households that would pass the income test(s) if subject to them and households that would fail the income test(s).

APPENDIX C
CALIFORNIA SSI RECIPIENTS

A. CALIFORNIA’S POLICY REGARDING SSI RECIPIENTS AND THE FOOD STAMP PROGRAM

In California, SSI recipients are not eligible for the standard FSP. As an alternative, they receive an additional \$10 as part of the state SSI supplement. California enacted the SSI policy based on the belief that, in part because of the state’s provision of a generous SSI supplement to SSI recipients, individuals receiving SSI who did qualify for the FSP would likely receive only the minimum benefit of \$10 for one- or two-person households.

As a result of California’s “cash-out” policy, pure SSI households—those in which all members receive SSI—are categorically ineligible for the FSP. In mixed SSI households—those in which some members receive SSI and others do not—the non-SSI recipients may apply for the FSP without including the SSI recipients in the application unit. In some of these cases, households that would not qualify for the FSP if the SSI recipients were included in the application are eligible when the SSI recipients (and their income) are excluded from the program.

Cunnyngham (2002) found that eliminating the SSI cash-out policy in 2000 would likely result in a net increase in FSP participants but a net decrease in total FSP benefits paid out. Elderly or disabled individuals living only with other SSI recipients and with little or no income beyond SSI and high out-of-pocket medical or shelter expenses would likely have benefited from elimination of the cash-out policy because they probably would have qualified for more than a \$10 benefit. On the other hand, families with both SSI recipients and non-recipients who were already participating in the FSP would likely either become ineligible for the FSP or qualify for a lower benefit if SSI participants were included in the FSP unit and their income were considered in the eligibility determination and benefit calculation. Cunnyngham estimated that the reduction in benefits for existing participants would have been slightly greater than the benefits gained by the newly eligible SSI recipients, thus accounting for the net reduction in benefits.

B. EFFECT OF SSI CASH-OUT ON ELIGIBILITY FOR THE FOOD STAMP PROGRAM

Given that the SSI cash-out policy affects only California, it is the major cause for variation in eligibility across states. To estimate the effect of the policy on the estimates presented in this report, we conducted a simulation that eliminated the SSI cash-out policy; Tables C.1 through C.6 present the results of the simulation. We estimate that the number of eligible households would increase by about 2 percent to 20.7 million households.

Under the simulation to end SSI cash-out, the characteristics of the national eligible population change only slightly. For instance, 67 percent of all eligible households would be in poverty with the elimination of SSI cash-out as compared to 68 percent under current policy (Tables C.1 and III.1). In addition, 20 percent of eligible households would have income from SSI and 32 percent from Social Security as compared to 18 and 31 percent, respectively.

A much larger change occurs, however, in the number and characteristics of households that are eligible in some but not all states. Under the simulation to eliminate SSI cash-out, the number of households eligible in some but not all states drops by over 50 percent (Tables C.4 and III.12). Among this group, the percentage in poverty drops from 63 percent under the current policy to 35 percent under the simulation to eliminate SSI cash-out. In addition, the percentage with earnings increases from 28 to 55 percent, and the percentage with income from SSI drops from 40 to 11 percent.

Among households eligible in some but not all states, the percentages with assets increase under the simulation to eliminate SSI cash-out. Sixty-eight percent have financial assets, 71 percent have vehicle assets, and 42 percent own a home as compared to 50, 50, and 33 percent, respectively, under the current policy.

As expected, these changes are most striking among households eligible in 47 to 50 states, with the number eligible dropping from over 4 million to under 1 million households (Table C.6).

Technical Appendices to Simulated Effects of Changes to State and Federal Asset Eligibility Policies for the Food Stamp Program

October 2008

Authors:

Karen Cunnyingham
James Ohls

This study was conducted by Mathematica Policy Research, Inc., under a cooperative research contract with USDA's Economic Research Service (ERS) Food and Nutrition Assistance Research Program (FANRP): contract number 59-5000-6-0077 (ERS project representative: Kenneth Hanson). The views expressed are those of the authors and not necessarily those of ERS or USDA.

TABLE D.1

CHARACTERISTICS OF ELIGIBLE AND PARTICIPATING HOUSEHOLDS IN 2006

	Households Eligible in 2006			
	All Eligible Households		Participating Households	
	Number (000s)	Percent of Total	Number (000s)	Percent of Total
Total Households	20,493	100.0	11,499	100.0
Gross Income as a Percentage of Poverty Level				
No income	2,301	11.2	1,887	16.4
1-50%	3,093	15.1	2,607	22.7
51-100%	8,578	41.9	5,107	44.4
101-130%	4,627	22.6	1,547	13.5
131-200%	1,789	8.7	312	2.7
Greater than 200%	105	0.5	39	0.3
Households with Income from				
Earnings	8,236	40.2	4,073	35.4
Temporary Assistance for Needy Families	1,597	7.8	1,407	12.2
Supplemental Security Income	3,589	17.5	2,383	20.7
Social Security	6,323	30.9	2,388	20.8
Benefit Level				
Eligible for minimum benefit	4,213	20.6	820	7.1
Eligible for maximum benefit	5,347	26.1	4,327	37.6
Eligible for other benefit	10,933	53.3	6,353	55.2
Households with Assets				
Financial Assets	10,065	49.1	4,777	41.5
Financial assets countable under state rules	4,547	22.2	2,096	18.2
Vehicle Assets	9,990	48.7	4,991	43.4
Vehicle assets countable under state rules	18	0.1	11	0.1
Home Equity	5,318	26.0	2,207	19.2
Household Composition				
Households with elderly adults	5,959	29.1	2,072	18.0
Households with disabled nonelderly adults	3,067	15.0	1,899	16.5
Households with children	8,456	41.3	5,668	49.3
With preschool-age children	4,107	20.0	2,892	25.1
With school-age children	6,701	32.7	4,465	38.8
Households with noncitizens	1,792	8.7	849	7.4
Household Food Security				
Food-secure	14,325	69.9	7,583	65.9
Low food-security	2,300	11.2	1,437	12.5
Very low food-security	1,483	7.2	977	8.5
Unknown	2,385	11.6	1,502	13.1

TABLE D.2

CHARACTERISTICS OF INDIVIDUALS IN ELIGIBLE AND PARTICIPATING HOUSEHOLDS IN 2006

	Individuals in Households Eligible in 2006			
	All Eligible Households		Participating Households	
	Number (000s)	Percent of Total	Number (000s)	Percent of Total
Total Individuals	44,641	100.0	26,125	100.0
Individuals by Household Gross Income as a Percentage of Poverty Level				
No income	3,991	8.9	3,340	12.8
1-50%	8,565	19.2	7,430	28.4
51-100%	17,824	39.9	10,876	41.6
101-130%	10,631	23.8	3,815	14.6
131-200%	3,483	7.8	607	2.3
Greater than 200%	146	0.3	57	0.2
Individuals in Households with Income from				
Earnings	23,518	52.7	11,718	44.9
Temporary Assistance for Needy Families	5,028	11.3	4,417	16.9
Supplemental Security Income	6,633	14.9	4,540	17.4
Social Security	9,638	21.6	3,919	15.0
Individuals by Household Benefit Level				
Eligible for minimum benefit	5,078	11.4	909	3.5
Eligible for maximum benefit	9,914	22.2	8,341	31.9
Eligible for other benefit	29,648	66.4	16,875	64.6
Individuals in Households with Assets				
Financial Assets	21,535	48.2	10,877	41.6
Financial assets countable under state rules	9,687	21.7	4,844	18.5
Vehicle Assets	24,328	54.5	12,847	49.2
Vehicle assets countable under state rules	34	0.1	21	0.1
Home Equity	12,122	27.2	5,782	22.1
Individuals by Household Composition				
Households with elderly adults	8,211	18.4	2,742	10.5
Households with disabled nonelderly adults	6,246	14.0	3,883	14.9
Households with children	29,755	66.7	19,444	74.4
With preschool-age children	15,565	34.9	10,718	41.0
With school-age children	24,985	56.0	16,218	62.1
Households with noncitizens	5,210	11.7	2,499	9.6
Individuals by Household Food Security				
Food-secure	30,518	68.4	17,151	65.7
Low food-security	5,660	12.7	3,537	13.5
Very low food-security	3,547	7.9	2,242	8.6
Unknown	4,915	11.0	3,195	12.2
