MISTLETOES ON INTRODUCED TREES OF THE WORLD

INTRODUCTION

Spaulding (1961) published the first attempt at a worldwide inventory of the diseases of foreign (introduced) trees of the world. With the widespread introduction of trees to many parts of the world, it is becoming of increasing importance to know the susceptibility of trees introduced to new disease situations. Spaulding's comprehensive lists included forest tree diseases caused by fungi, bacteria, and viruses, but not the mistletoes. Therefore this publication on the mistletoes was prepared to supplement his work.

Spaulding considered only forest trees, but the coverage here is expanded to include mistletoes parasitic on introduced forest, crop, orchard, and ornamental trees. In some instances, mistletoes are reported on trees cultivated within different parts of a country where the tree is native. Such records are included if it is indicated in the publication that the mistletoe in question is on planted trees.

"Mistletoe" as used in this paper refers to any member of the families Loranthaceae or Viscaceae. Mistletoes on hosts outside the known natural range of the mistletoe are included even though the native range may be in a different part of the same country. For example, the mistletoe *Phoradendron tomentosum* subsp. *macrophyllum* of the western United States is listed on *Robinia pseudoacacia*, a tree native to eastern North America.

This list includes only introduced-host situations, where a tree is grown outside its natural range and within that of a particular mistletoe. It does not include such introduced-parasite situations as in California (McCartney 1968), where the introduced mistletoe *Viscum album* parasitizes many native and introduced trees.

Although this is the first attempt to compile a world list of mistletoes on introduced hosts, many general works mention some of these host-parasite combinations (Greenham and Hawksworth 1966, Gill and Hawksworth 1961, Kuijt 1969, Lanier 1969, and Srinivasan and Subramanian 1960). In addition, several publications of the mistletoe floras of various countries contain many such records. Some that were particularly useful are: Abbiatti 1946 (Argentina), Balle 1948 (Congo=Zaire), Balle 1958 (West Africa), Balle 1960 and 1964 (Madagascar=Malagasy Republic), Balle and Halle 1961 (Ivory Coast), Blakely 1922 a-c (Australia), Fischer 1926 (Southern India), Sands 1924 (Malaya) and Weeraratna 1960 (Ceylon=Sri Lanka). Also several monographs contain host records of introduced trees such as: Bojarczuk 1971 (*Viscum album* in Poland), Florance 1914 (*Viscum album* in France), Hawksworth and Wiens 1972 (*Arceuthobium*), Singh 1962 (*Dendrophthoe falcata*), and Tubeuf 1923 (*Viscum album*).

The mistletoes parasitize mainly trees, but the records here include both trees and shrubs. The Australian *Nutsyia floribunda*, (a root parasite) parasitizes introduced trees, shrubs, and even annuals; such records are included here.

In many parts of the world, mistletoes have readily adapted to new ecological niches presented by introduced trees (Kuijt 1964c, Room 1973). Hybrids in the mistletoes are generally very rare, but it is perhaps significant that in Australia apparent hybrids between two species of *Muellerina* occur mostly on introduced trees (Barlow 1966). As Barlow suggests, the two mistletoes are ecologically isolated by their differential host preferences; thus hybrids may be more likely to survive on hosts to which the parent species are not adapted.

I originally hoped to indicate the severity of attack by various mistletoes on each introduced tree species. However, such information is generally not available. Some instances in which parasitism by native mistletoes on introduced or cultivated trees is particularly damaging include:

1. *Viscum album* on black locust (*Robinia pseudoacacia*) in Europe.
2. *Tapinanthus banguensis* on cacao (*Theobroma cacao*) in Africa.
3. *Dendrophthoe pentandra* on kapok (*Ceiba pentandra*) in Java.
4. *Phthirusa* on teak (*Tectona grandis*) in Trinidad.
5. "*Loranthus*" on rubber tree (*Hevea brasiliensis*) in Malaya.
6. *Oryctanthus* spp. and *Phoradendron piperoides* on cacao (*Theobroma cacao*) in Costa Rica.

One of the most bizarre occurrences of a mistletoe on an introduced tree is *Macrosolen albicaulis* Wiens on *Ficus religiosa* L., a sacred tree brought into Sri Lanka (Ceylon) from Nepal over 2,000 years ago (Wiens 1971). *M. albicaulis* is common on *F. religiosa* in Sri Lanka, where it is the only known host. The mistletoe apparently does not occur in Nepal, so it is not known whether the species has evolved in Sri Lanka since the introduction of the host there, or whether it was inadvertently brought in with the host. Because of the questionable origin of this mistletoe, it is not included here.

This paper was prepared as a project of the Mistletoe Working Party of the F.A.O./International Union of Forest Research Organizations. Although such a work can never be complete, I have attempted to make the lists as complete and up-to-date as possible. Over 6,000 publications from all parts of the world were searched for references to occurrence of mistletoes on introduced trees. About 150 contained such information and are cited here.

I would appreciate having any additions or errors brought to my attention.

The format of Spaulding's (1961) publication is followed here. The first section lists the mistletoes alphabetically with the introduced hosts reported for each. The second section, starting on page 27, is a host index.

MISTLETOES AND HOSTS

In this section, the scientific name for the mistletoe is given first. Next the scientific names of introduced hosts of the mistletoe are listed. On the same line, the area of origin of the tree, if known, is listed in brackets. The next line gives the country where the record is from and the literature reference. Hosts of a particular mistletoe known only from artificial inoculation experiments are indicated by an asterisk (*).

Where possible, the latest scientific names were used for each mistletoe. The situation is particularly confusing in "*Loranthus*," however. Hundreds of "*Loranthus*" species have been described, but essentially all of them have now been assigned to other genera. For names of the species of "*Loranthus*," the work of Danser (1933) has been followed. References that use "*Loranthus*" without a specific name are retained as such. A similar situation exists for *Phrygilanthus*; all species once in this genus have now been assigned to other genera (Barlow and Wiens 1973). Several reports do not give the scientific names of mistletoes involved, but record them only as a "mistletoe"—and this is the way they are listed here. In some cases it has not been possible to determine the area of origin of some tree species, particularly for widely domesticated orchard species such as *Malus*, *Pyrus*, *Citrus*, etc.

Authors for the host tree names have been verified by Elbert L. Little, Jr., Dendrologist, USDA Forest Service, Washington, D.C. Synonyms for tree names are not listed separately; the latest generally accepted name is used.

Agelanthus brunneus (Engl.)

 Australia—Turner 1895

Quercus lusitanica [Spain, Portugal]
 Australia—Turner 1895
Quercus robur [Europe, N. Africa, W. Asia]
 Australia—Turner 1895
Robinia pseudoacacia [E. U.S.]
 Australia—Turner 1895
 India—Bidie 1874
Salix babylonica [China]
 Australia—Turner 1895
Sapium sebiferum [China]
 Australia—Turner 1895
Ulmus glabra [Europe, W. Asia]
 Australia—Turner 1895
Zelkova serrata [Japan]
 Australia—Turner 1895

HOST INDEX OF MISTLETOES

This section is an index of the host-parasite combinations listed in the previous section. The scientific name, author, and common name (if available) of each host are given along with the mistletoes reported on that host. Records of unnamed "mistletoes" are cited if there are no other records.

<i>Abies amabilis</i> (Dougl.) Forbes	(Merr.) Lemm.	corkbark fir
Pacific silver fir	<i>Viscum album</i>	
<i>Viscum album</i>	<i>Acacia</i> sp. [Australia]	acacia
<i>Abies balsamea</i> (L.) Mill.	<i>Helixanthera wallichiana</i>	
balsam fir	<i>Taxillus cuneatus</i>	
<i>Viscum album</i>	<i>Taxillus recurvus</i>	
<i>Abies concolor</i> (Gord. & Glend.)	<i>Taxillus tomentosus</i>	
Lindl.	<i>Acacia farnesiana</i> (L.) Willd.	
white fir	sweet acacia	
<i>Viscum album</i>	<i>Dendrophthoe falcata</i>	
<i>Abies firma</i> Sieb. & Zucc.	<i>Acacia melanoxyylon</i> R. Br.	
moni fir	blackwood acacia	
<i>Viscum album</i>	<i>Dendroththoe falcata</i>	
<i>Abies fraseri</i> (Pursh) Poir.	<i>Elytranthe parasitica</i>	
Fraser fir	<i>Loranthus</i> sp.	
<i>Viscum album</i>	<i>Acer heldreichii</i> Orph.	
<i>Abies grandis</i> (Dougl.) Lindl.	Balkan maple	
grand fir	<i>Viscum album</i>	
<i>Viscum album</i>	<i>Acer lobelii</i> Ten.	Lobel maple
<i>Abies homolepis</i> Sieb. & Zucc.	<i>Viscum album</i>	
Nikko fir	<i>Acer miyabei</i> Maxim.	
<i>Viscum album</i>	Miyabe maple	
<i>Abies lasiocarpa</i> var. <i>arizonica</i>		

- Viscum album*
Acer monspessulanum L. Montpelier maple
